Expert system and applications:

Introduction

What is an Expert System?

An Expert System is a computer program that is designed to solve complex problems and to provide decision-making ability like a human expert. It performs this by extracting knowledge from its knowledge base using the reasoning and inference rules according to the user queries.

The expert system is a part of AI, and the first ES was developed in the year 1970, which was the first successful approach of artificial intelligence. It solves the most complex issue as an expert by extracting the knowledge stored in its knowledge base. The system helps in decision making for complex problems using both facts and heuristics like a human expert. It is called so because it contains the expert knowledge of a specific domain and can solve any complex problem of that particular domain. These systems are designed for a specific domain, such as medicine, science, etc..

The performance of an expert system is based on the expert's knowledge stored in its knowledge base. The more knowledge stored in the K.B, the more that system improves its performance. One of the common examples of an ES is a suggestion of spelling errors while typing in the Google search box..

Below is the block diagram that represents the working of an expert system:
