Annual Plant Reviews, Seed Development, Dormancy and Germination Kent Bradford, Hiro Nonogaki, 2008-04-15 The formation dispersal and germination of seeds are crucial stages in the life cycles of gymnosperm and angiosperm plants The unique properties of seeds particularly their tolerance to desiccation their mobility and their ability to schedule their germination to coincide with times when environmental conditions are favorable to their survival as seedlings have no doubt contributed significantly to the success of seed bearing

plants Humans are also dependent upon seeds which constitute the majority of the world's staple foods e.g. cereals and legumes Seeds are an excellent system for studying fundamental developmental processes in plant biology as they develop from a single fertilized zygote into an embryo and endosperm in association with the surrounding maternal tissues As genetic and molecular approaches have become increasingly powerful tools for biological research seeds have become an attractive system in which to study a wide array of metabolic processes and regulatory systems Seed Development Dormancy and Germination provides a comprehensive overview of seed biology from the point of view of the developmental and regulatory processes that are involved in the transition from a developing seed through dormancy and into germination and seedling growth It examines the complexity of the environmental physiological molecular and genetic interactions that occur through the life cycle of seeds along with the concepts and approaches used to analyze seed dormancy and germination behavior It also identifies the current challenges and remaining questions for future research The book is directed at plant

Climate Change and Global Crop Productivity K. R. Reddy,H. F. Hodges,2000-04-25 Annotation Worldwide climatic changes have been raising

concerns about potential changes to crop yields and production systems. Such concerns include the ability to accommodate these uncertain effects in order to ensure an adequate food supply for an increasing population. Written by leading international experts, this book is the first comprehensive examination of the potential effects climate change, particularly green house gases, will have on agroecosystems. It also reviews the effects such systems have on climate change itself.

"One Rotten Apple Spoils the Whole Barrel": The Plant Hormone Ethylene, the Small Molecule and its Complexity Domenico De Martinis, Tomotsugu Koyama, Caren Chang, 2015-08-14

The gaseous molecule ethylene (C_2H_4), which is small in size and simple in structure, is a plant hormone most often associated with fruit ripening, yet has a diversity of effects throughout the plant life cycle. While its agricultural effects were known even in ancient Egypt, the complexity of its mode of action and the broad spectrum of its effects and potential uses in plant physiology remain important scientific challenges today. In the last few decades, the biochemical pathway of ethylene production has been uncovered; ethylene perception and signaling have been molecularly dissected; ethylene responsive transcription factors have been identified; and numerous effects of ethylene have been described, ranging from water stress, development, senescence, reproduction, plant pathogen interactions, and, of course, ripening. Thus, ethylene is involved in plant development, in biotic and abiotic stress, and in reproduction. There is no stage in plant life that is not affected by ethylene, modulated by a complex and fascinating molecular machinery.
