Secret Worlds Martin Stevens, 2021-06-10 Martin Stevens explores the extraordinary variety of senses in the animal kingdom and discusses the cutting edge science that is shedding light on these secret worlds. Our senses of vision, smell, taste, hearing, and touch are essential for us to respond to threats, communicate, and interact with the world around us. This is true for all animals; their sensory systems are key to survival, and without them, animals would be completely helpless. However, the sensory systems of other animals work very differently from ours. For example, many animals, from spiders to birds, can detect and respond to ultraviolet light to which we are blind. Other animals, including many insects, rodents, and bats, can hear high frequency ultrasonic sounds well beyond our own hearing range. Many other species have sensory systems that we lack completely, such as the magnetic sense of birds, turtles, and other animals, or the electric sense of many fish. These differences in sensory ability have a major bearing on the ways that animals behave and live in different environments and also affect their evolution and ecology. In this book, Martin Stevens explores the remarkable sensory systems that exist in nature and what they are used for. Discussing how different animal senses work, he also considers how they evolve, how they are shaped by the environment in which an animal lives, and the pioneering science that has uncovered how animals use their senses. Throughout, he celebrates the remarkable diversity of life and shows how the study of sensory systems has shed light on some of the most important issues in animal behaviour, physiology, and evolution.

The Escape of the Mind Howard Rachlin PhD, 2014-06-02 The Escape of the Mind is part of a current movement in psychology and philosophy of mind that calls into question what is perhaps our most basic, most cherished, and universally accepted belief: that our minds are inside of our bodies. Howard Rachlin adopts the counterintuitive position that our minds, conscious and unconscious, lie not where our firmest yet unsupported introspections tell us they are, but in how we actually behave over the long run. Perhaps paradoxically, the book argues that our introspections, no matter how positive we are about them, tell us absolutely nothing about our minds. The name of the present version of this approach to the mind is teleological behaviorism. The approaches of teleological behaviorism will be useful in the science of individual behavior for developing methods of self control, and in the science of social behavior for developing social cooperation. Without in any way denigrating the many contributions of neuroscience to human welfare, The Escape of the Mind argues that neuroscience, like introspection, is not a royal road to the understanding of the mind. Where then should we look to explain a present act that is clearly caused by the mind? Teleological behaviorism says to look not in the spatial recesses of the nervous system, not to the mechanism underlying the act, but in the temporal recesses of past and future overt behavior, to the pattern of which the act is a part. But scientific usefulness is not the only reason for adopting teleological behaviorism. The final two chapters, on IBM's computer Watson, how it deviates from humanity and how it would have to be altered to make it human, and on shaping a coherent self,

Seeing Red Jose P. Zagal,Benj Edwards,2024-05-14 The curious history technology and technocultural context of Nintendo s short lived stereoscopic gaming console the Virtual Boy With glowing red stereoscopic 3D graphics the Virtual Boy cast a prophetic hue Shortly after its release in 1995 Nintendo s balance sheet for the product was in the red as well Of all the innovative long shots the game industry has witnessed over the years perhaps the most infamous and least understood was the Virtual Boy Why the Virtual Boy failed and where it succeeded are questions that video game experts Jos Zagal and Benj Edwards explore in *Seeing Red* but even more interesting to the authors is what the platform actually was what it promised how it worked and where it fit into the story of gaming Nintendo released the Virtual Boy as a standalone table top device in 1995 and quickly discontinued it after lackluster sales and a lukewarm critical reception In *Seeing Red* Zagal and Edwards examine the device s technical capabilities its games and the cultural context in the US in the 1990s when Nintendo developed and released the unusual console The Virtual Boy in their account built upon and extended an often forgotten

historical tradition of immersive layered dioramas going back 100 years that was largely unexplored in video games at the time The authors also show how the platform s library of games conveyed a distinct visual aesthetic style that has not been significantly explored since the Virtual Boy s release having been superseded by polygonal 3D graphics The platform s meaning they contend lies as much in its design and technical capabilities and affordances as it does in an audience s perception of those capabilities Offering rare insight into how we think about video game platforms Seeing Red illustrates where perception and context come quite literally into play **NBS Special Publication** ,1979 **Ophthalmology**

Frisby,James V. Stone,2010-04-02 An accessible yet rigorous and generously illustrated exploration of the computational approach to the study of biological vision Seeing has puzzled scientists and philosophers for centuries and it continues to do so This new edition of a classic text offers an accessible but rigorous introduction to the computational approach to understanding biological visual systems The authors of Seeing taking as their premise David Marr s statement that to understand vision by studying only neurons is like trying to understand bird flight by studying only feathers make use of Marr s three different levels of analysis in the study of vision the computational level the algorithmic level and the hardware implementation level Each chapter applies this approach to a different topic in vision by examining the problems the visual system encounters in interpreting retinal images and the constraints available to solve these problems the algorithms that can realize the solution and the implementation of these algorithms in neurons Seeing has been thoroughly updated for this edition and expanded to more than three times its original length It is designed to lead the reader through the problems of vision from the common but mistaken idea that seeing consists just of making pictures in the brain to the minutiae of how neurons collectively encode the visual features that underpin seeing Although it assumes no prior knowledge of the field some chapters present advanced material This makes it the only textbook suitable for both undergraduate and graduate students that takes a consistently computational perspective offering a firm conceptual basis for tackling the vast literature on vision It covers a wide range of topics including aftereffects the retina receptive fields object recognition brain maps Bayesian perception motion color and stereopsis MatLab code is available on the book s website
