Sciences and Resources, Committee on the Science of Earthquakes, 2003-09-22 The destructive force of earthquakes has stimulated human inquiry since ancient times yet the scientific study of earthquakes is a surprisingly recent endeavor Instrumental recordings of earthquakes were not made until the second half of the 19th century and the primary mechanism for generating seismic waves was not identified until the beginning of the 20th century From this recent start a range of laboratory field and theoretical investigations have developed into a vigorous new discipline the science of earthquakes As a basic science it provides a comprehensive understanding of earthquake behavior and related phenomena in the Earth and other terrestrial planets As an applied science it provides a knowledge base of great practical value for a global society whose infrastructure is built on the Earth's active crust This book describes the growth and origins of earthquake science and identifies research and data collection efforts that will strengthen the scientific and social contributions of this exciting new discipline

*Flat Earth and Round Earth* Rebecca Stefoff, 2014-01-01 It can be hard to imagine a time when it was generally believed that the shape of our earth was a flat plane or disk This book exposes the bizarre and sometimes hilarious history of science explores pseudo scientific theories from the past and the scientific progress made since then through use of the scientific method Through the scientific method anecdotes historic facts and the scientific theories themselves it tells the story of why people of a particular time period believed in such things and the discoveries that led us to learn otherwise

**Observation of the Earth System from Space** Jakob Flury, Reiner Rummel, Christoph Reigber, Markus Rothacher, Gerd Boedecker, Ulrich Schreiber, 2006-02-28 In the recent years space based observation methods have led to a substantially improved understanding of Earth system Geodesy and geophysics are contributing to this development by measuring the temporal and spatial variations of the Earth's shape gravity field and magnetic field as well as at sphere density In the frame of the German R D programme GEOTECHNOLOGIEN research projects have been launched in 2002 related to the satellite missions CHAMP GRACE and ESA's planned mission GOCE to complementary terrestrial and airborne sensor systems and to consistent and stable high precision global reference systems for satellite and other techniques In the initial 3 year phase of the research programme 2002-2004 new gravity field models have been computed from CHAMP and GRACE data which outperform previous models in accuracy by up to two orders of magnitude for the long and medium wavelengths A special highlight is the termination of seasonal gravity variations caused by changes in continental water masses For GOCE to be launched in 2006 new gravity field analysis methods are under development and integrated into the ESA processing system 200 000 GPS radio occultation profiles observed by CHAMP have been processed on an operational basis They represent new and excellent information on atmospheric refractivity temperature and water vapor These new developments require geodetic space techniques such as VLBI SLR LLR GPS to be combined and synchronized as if being one global instrument

**Rare Earth Minerals** Yves Earhart, 2024-11-17 Rare Earth Minerals offers a comprehensive exploration of seventeen essential elements that form the foundation of modern technology from smartphones to renewable energy systems The book uniquely

bridges the gap between complex geological science and practical applications making technical concepts accessible to readers across various professional backgrounds Through a systematic approach it reveals how these elements despite their misleading name aren't actually rare but are challenging to extract economically creating significant implications for global supply chains and technological advancement The narrative progresses through three interconnected sections beginning with fundamental geological principles and formation processes of rare earth elements Moving from science to application the second section examines how these minerals enable crucial technologies in consumer electronics defense systems and green energy initiatives The final section tackles the geopolitical dimension exploring how these resources influence international relations and environmental sustainability What sets this book apart is its interdisciplinary approach combining geological expertise with insights into international relations and industrial engineering Drawing from extensive research including geological surveys and industrial reports it presents real world case studies from major mining operations globally The book serves as both an educational resource and strategic planning tool offering practical guidance for industry professionals policymakers and environmental advocates while maintaining scientific accuracy and addressing current debates about sustainable mining practices and supply chain security

*When Maps Become the World* Rasmus Grønfeldt Winther, 2020-06-29 Map making and ultimately map thinking is ubiquitous across literature cosmology mathematics psychology and genetics We partition summarize organize and clarify our world via spatialized representations Our maps and more generally our representations seduce and persuade they build and destroy They are the ultimate record of empires and of our evolving comprehension of our world This book is about the promises and perils of map thinking Maps are purpose driven abstractions discarding detail to highlight only particular features of a territory By preserving certain features at the expense of others they can be used to reinforce a privileged position When Maps Become the World shows us how the scientific theories models and concepts we use to intervene in the world function as maps and explores the consequences of this both good and bad We increasingly understand the world around us in terms of models to the extent that we often take the models for reality Winther explains how in time our historical representations in science in cartography and in our stories about ourselves replace individual memories and become dominant social narratives they become reality and they can remake the world

**Working with Map Projections** Fritz Kessler, Sarah Battersby, 2019-05-03 A map projection fundamentally impacts the mapmaking process Working with Map Projections A Guide to Their Selection explains why for any given map there isn't a single best map projection Selecting a projection is a matter of understanding the compromises and consequences of showing a 3 D space in two dimensions The book presents a clear understanding of the processes necessary to make logical decisions on selecting an appropriate map projection for a given data set The authors discuss the logic needed in the selection process describe why certain decisions should be made and explain the consequences of any inappropriate decision made during the selection process This book also explains how the map projection will impact the map's ability to fulfill its purpose uses real world data sets as the basis for the selection of an appropriate map projection and provides illustrations of an appropriately and inappropriately selected map projection for a given data set The authors take a novel approach to discussing map projections by avoiding an extensive inventory of mathematical formulae and using only the mathematics of map projections that matter for many mapping tasks They also present information that is directly applicable to the process of selecting map projections and not tied to a specific software package Written by two leading experts this book is an invaluable resource for anyone studying or working with geospatial data from students to experienced professionals and will help readers successfully weigh the pros and cons of choosing one projection over another to suit a map's intended purpose
