Mathematical Systems, Theory and Economics, Vol.: 2 H.W. Kuhn, G.P. Szegö, 1969 **The Paretian Tradition During the Interwar Period** Mario Pomini, 2014-06-05

The years in between the two World Wars were a crucial period for the building of economic dynamics as an autonomous field. Different competing research programs arose at international level. Great progress was achieved by studies on the business cycle with the first statistical applications. Outside the theory of the business cycle a significant line of inquiry was that pursued at the end of the 1930s by Hicks and Samuelson. This period also saw the formulation of another approach to formal economic dynamics which in the 1930s represented the frontier of research from the analytical point of view. It was an approach which set the notion of equilibrium at the basis of dynamics exactly as in the case of statics thus leading to the definition of a dynamic equilibrium approach. The aim of this volume is to take into consideration this original research field sparked from Pareto's works and initially developed during the 1920s in the United States by two American mathematicians G. Evans and C. Ross. In the 1930s the concept of dynamic equilibrium became the main research field of the Pareto school which gave its most important contributions in this field. The Paretian economists as Amoroso, de Pietri, Tonelli, Sensi and the younger such as Bordin, Palomba, La Volpe, Fossati and Zaccagnini for the most part students of the former developed this approach in many directions. The theory of dynamic equilibrium reached remarkable results from an analytical viewpoint through the wide application of the functional calculus thus anticipating a perspective which was taken into consideration in the 1960s with the theory of optimal growth. Despite the Pareto school's relevance it remained widely unknown not only at international level but also in Italy. Recently it has been object of renewed interest. This present work aims at reconstructing the fundamental contributions offered by the Pareto school in forming the economic dynamics theory.

Theory and Methods of Vector Optimization (Volume One) Yu. K. Mashunin, 2020-03-24

This first volume presents the theory and methods of solving vector optimization problems using initial definitions that include axioms and the optimality principle. This book proves mathematically that the result it presents for the solution of the vector multi-criteria problem is the optimal outcome and as such solves the problem of vector optimization for the first time. It shows that applied methods of solving vector optimization problems can be used by researchers in modeling and simulating the development of economic systems and technical engineering systems.

Mathematical Methods of Game and Economic Theory Jean-Pierre Aubin, 2007-01-01

Mathematical economics and game theory approached with the fundamental mathematical toolbox of nonlinear functional analysis are the central themes of this text. Both optimization and equilibrium theories are covered in full detail. The book's central application is the fundamental economic problem of allocating scarce resources among competing agents which leads to considerations of the interrelated applications in game theory and the theory of optimization. Mathematicians, mathematical economists and operations research specialists will find that it provides a solid foundation in nonlinear functional analysis. This text begins by developing linear and convex analysis in the context of

optimization theory The treatment includes results on the existence and stability of solutions to optimization problems as well as an introduction to duality theory The second part explores a number of topics in game theory and mathematical economics including two person games which provide the framework to study theorems of nonlinear analysis The text concludes with an introduction to non linear analysis and optimal control theory including an array of fixed point and subjectivity theorems that offer powerful tools in proving existence theorems

A Disequilibrium Model of Real and Financial Accumulation in an Open Economy Giancarlo Gandolfo, Pietro C. Padoan, 2012-12-06 This is the fourth version of a model that five years ago we set out to build and estimate along the lines of the continuous time approach clarified In chapter 1 Previous versions appeared in journal articles and conference proceedings where the space is notoriously limited Therefore we welcome the possibility of publishing a book length treatment of this fourth version so that we can describe its theoretical and empirical aspects in some detail Although we have worked closely together and accept joint responsibility for the whole book chs 1 and 2 and appendix I have been written by G Gandolfo whilst chs 3 and 4 and appendix II have been written by P c Padoan Different parts of this version of the model have been discussed In various lectures at the European University Institute Florence in 1984 In a seminar organized by the Bank of Italy Sadiba Perugia Italy February 16 18 1984 in the second Viennese Workshop on Economic Applications of Control Theory Vienna May 16 18 1984 and in the sixth annual Conference of the Society for Economic Dynamics and Control Nice France June 13 15 1984 In all of these we received helpful comments similarly helpful were the comments of Clifford R Wymer who however is absolved of any responsibility

Lectures on Macroeconomics Olivier Blanchard, Stanley Fischer, 1989-03-21 The main purpose of Lectures on Macroeconomics is to characterize and explain fluctuations in output unemployment and movement in prices Lectures on Macroeconomics provides the first comprehensive description and evaluation of macroeconomic theory in many years While the authors perspective is broad they clearly state their assessment of what is important and what is not as they present the essence of macroeconomic theory today The main purpose of Lectures on Macroeconomics is to characterize and explain fluctuations in output unemployment and movement in prices The most important fact of modern economic history is persistent long term growth but as the book makes clear this growth is far from steady The authors analyze and explore these fluctuations Topics include consumption and investment the Overlapping Generations Model money multiple equilibria bubbles and stability the role of nominal rigidities competitive equilibrium business cycles nominal rigidities and economic fluctuations goods labor and credit markets and monetary and fiscal policy issues Each of chapters 2 through 9 discusses models appropriate to the topic Chapter 10 then draws on the previous chapters asks which models are the workhorses of macroeconomics and sets the models out in convenient form A concluding chapter analyzes the goals of economic policy monetary policy fiscal policy and dynamic inconsistency Written as a text for graduate students with some background in macroeconomics statistics and econometrics Lectures on Macroeconomics also presents topics in a self contained way that makes it a suitable reference for

professional economists *Spectral Theory of Value and Actual Economies* Theodore Mariolis, Nikolaos Rodousakis, George Soklis, 2021-05-29 This book develops a unified treatment of the income distribution capital value problems with respect to actual economies and then gradually turns to the issues of effective demand and capitalist accumulation fluctuations from both political economy and economic policy perspectives That treatment on the one hand places produced means of production positive profits and capital accumulation at the centre of the analysis and on the other hand is analytically based on the modern control theory Hence the authors investigation is concerned with input output representations of actual single and joint production heterogeneous labour and open economies zeroes in on the characteristic value distributions of the system matrices and finally derives meaningful theoretical results consistent with the empirical evidence and vice versa The main topics addressed are the uncontrollable unobservable aspects of the real world economies the powerful low order spectral approximations and reconstructions of the inter industry structure of production value distributive variables relationships the critical constructive appraisal of both mainstream and radical theories of value the matrix demand multipliers and demand switching policies in heterogeneous capital worlds and the circular inter actions amongst income distribution effective demand accumulation and technical conditions of production Written on the occasion of the 60th anniversary of the publication of both Piero Sraffa's *Production of Commodities by Means of Commodities* and Rudolf E Kalman's paper *On the general theory of control systems* this book provides a consistent and comprehensive framework for theoretical empirical and economic policy research **The Hamiltonian Approach to Dynamic Economics** David

Cass, Karl Shell, 2014-05-10 The Hamiltonian Approach to Dynamic Economics focuses on the application of the Hamiltonian approach to dynamic economics and attempts to provide some unification of the theory of heterogeneous capital Emphasis is placed on the stability of long run steady state equilibrium in models of heterogeneous capital accumulation Generalizations of the Samuelson Scheinkman approach are also given Moreover conditions are sought on the geometry of the Hamiltonian function that is on static technology that suffice to preserve under not necessarily small perturbation the basic properties of the Hamiltonian dynamical system Comprised of eight essays this book begins with an introduction to Hamiltonian dynamics in economics followed by a discussion on optimal steady states of n sector growth models when utility is discounted Optimal growth and decentralized or descriptive growth models in both continuous and discrete time are treated as applications of Hamiltonian dynamics The problem of optimal growth with zero discounting is considered with emphasis on a steepness condition on the Hamiltonian function The general problem of decentralized growth with instantaneously adjusted expectations about price changes is also analyzed along with the global asymptotic stability of optimal control systems with applications to the theory of economic growth This monograph will be of value to mathematicians and economists

Toward a General Theory of Exchange Javid R. Khwaja, 2013 The new economy under the impetus of the ever widening outreach of the Internet is undergoing a transition In the meantime there's also been a shift to the information

paradigm with its emphasis on lack of foresight These processes have almost completely supplanted the concept of market that was once one of the most cardinal features of conventional economic theory In *Toward a General Theory of Exchange Strategic Decisions and Complexity* author Dr Javid R Khwaja traces the slow melting of the market the most ubiquitous contraption and the summum bonum of economic science as an organized manifestation of complexity with its wide ranging impact on the flow of funds Using the historical background of economic theories this study blends the interdisciplinary range and fills the vacuum that has existed among current conventional economic theory the theory of strategic decision making actor network theory the domain of law and economics and the science of complexity An observer of economic development for several decades Khwaja shows the relationship between technology and economics and how it affects social exchanges and trends

A Mathematical Treatment of Economic Cooperation and Competition Among Nations, with Nigeria, USA, UK, China, and the Middle East Examples Ethelbert N. Chukwu, 2005-09-30 The book presents a careful mathematical study of Economic Cooperation and Competition among Nations It appropriates the principles of Supply and Demand and of Rational Expectations to build the dynamic model of the Gross Domestic Products of two groups of nations which are linked up together The first group consists of Nigeria the US the UK and China The second group is made up of Egypt the US Jordan and Israel The link connecting the four nations of each group is mirrored in the net export function which is broadened to include trade debts and the inflow or the outflow of wealth from the competing and cooperating nations This realistic models of the four interacting GDP s a hereditary differential game of pursuit are validated with historical data from International Financial Statistic Year Book The Mathematical model is then studied for controllability from a current initial GDPs a better state can be attained using government and private strategies which are carefully identified We use regression and differential equation methods to test whether the four countries are competing or cooperating The consequences of competition or cooperation are explored Cooperation can be realized and the growth of wealth assured because the system is controllable and we can increase the growth of GDP and then increase the coefficient of cooperation The outcome may be unbounded growth of wealth for all concerned the triumph of cooperation With analogous simple examples the book shows that sufficiently cooperating systems grow unbounded and competing ones are either bounded at best or become extinct in finite time If competition is small i e limited or regulated the GDP s need not be

extinct even after a long time This results are in contrast with popular opinion which advocate competition over cooperation The detailed policy implication of the cooperation analysis at one time or the other were advocated by Pope John Paul II President Clinton and President Bush The mathematical message is clear the strategy of cooperation is the best way in an Interconnected World Cooperation triumphs over competition The same type of analysis allows the book to argue through modeling that prosperity internal peace and harmony can flourish in Nigeria among the old three regions and the newer six geopolitical regions The same is true for the four powerful states in the Middle East Thus the author s refreshing approach is the scientific treatment of cooperation and competition models of the gross domestic product of two groups of nations Nigeria the USA the UK and China and the USA Egypt Jordan and Israel Attempts are made to provide scientific answers to broad national policies It allows predictions of growth to be made with some degree of accuracy for up to 4 years MATLAB and Maple programs in accompanied CD are provided The author s individual nations economic models are cited The dynamics are ordinary and hereditary games of pursuit also cited from the original earlier writings of the author are models of the economic state of each nation a vector of six things the gross domestic product GDP y interest rate R employment or unemployment L value of capital stock k prices p t and therefore inflation and cumulative balance of payment E Each economic state is isolated except the impact of export function on aggregate demand The main difference between this earlier contributions and this book is the link and its apparent policy implications and consequences Key features

Optimal Control Theory Suresh P. Sethi, 2018-11-28 This fully revised 3rd edition offers an introduction to optimal control theory and its diverse applications in management science and economics It brings to students the concept of the maximum principle in continuous as well as discrete time by using dynamic programming and Kuhn Tucker theory While some mathematical background is needed the emphasis of the book is not on mathematical rigor but on modeling realistic situations faced in business and economics The book exploits optimal control theory to the functional areas of management including finance production and marketing and to economics of growth and of natural resources In addition this new edition features materials on stochastic Nash and Stackelberg differential games and an adverse selection model in the principal agent framework The book provides exercises

for each chapter and answers to selected exercises to help deepen the understanding of the material presented Also included are appendices comprised of supplementary material on the solution of differential equations the calculus of variations and its relationships to the maximum principle and special topics including the Kalman filter certainty equivalence singular control a global saddle point theorem Sethi Skiba points and distributed parameter systems Optimal control methods are used to determine optimal ways to control a dynamic system The theoretical work in this field serves as a foundation for the book which the author has applied to business management problems developed from his research and classroom instruction The new edition has been completely refined and brought up to date Ultimately this should continue to be a valuable resource for graduate courses on applied optimal control theory but also for financial and industrial engineers economists and operational researchers concerned with the application of dynamic optimization in their fields
