Proceedings of the Second European Symposium on Mathematics in Industry H Neunzert, 2012-12-06 Mathematics in Industry since the volume containing the proceedings of the 1985 Oberwolfach conference was published this subject has become more fashionable in Europe America and also in the third world The Europeans have come closer to each other They formed a European Consortium for Mathematics in Industry abbreviated ECMI This ECMI supported mainly by mathematicians from Amsterdam Bari Eindhoven Firenze Kaiserslautern Limerick Linz Paris Oxford and Trondheim has become a legal entity with a rapidly growing number of members It has organized a common really European postgraduate programme establishes contact between industry and universities and organizes other conferences everywhere in the world Industrial mathematics is a special method to get interesting problems a special attitude of curiosity for technical or economical questions a general rather broad knowledge in all branches of mathematics but it always remains real mathematics Our first proceedings contained many articles about why and how to start Now we are more selfconfident about our ideas These proceedings include only examples of how to do It is a pleasure to see how many different kinds of good mathematics are applied to so many different problems from industry Part of the selection criteria for this volume was that some of the applications of what is usually considered ivory tower mathematics be represented **Proceedings of the**

innovation and thereby highlights the importance and relevance of the concept Mathematics\_FOR\_Industry The contents of this volume address productive and successful interaction between industry and mathematicians as well as the cross fertilization and collaboration that result when mathematics is involved with the advancement of science and technology

*Modeling and Analysis of Linear Hyperbolic Systems of Balance Laws* Krzysztof Bartecki, 2015-12-21 This monograph focuses on the mathematical modeling of distributed parameter systems in which mass energy transport or wave propagation phenomena occur and which are described by partial differential equations of hyperbolic type The case of linear or linearized  $2 \times 2$  hyperbolic systems of balance laws is considered i e systems described by two coupled linear partial differential equations with two variables representing physical quantities depending on both time and one dimensional spatial variable Based on practical examples of a double pipe heat exchanger and a transportation pipeline two typical configurations of boundary input signals are analyzed collocated wherein both signals affect the system at the same spatial point and anti collocated in which the input signals are applied to the two different end points of the system The results of this book emerge from the practical experience of the author gained during his studies conducted in the experimental installation of a heat exchange center as well as from his research experience in the field of mathematical and computer modeling of dynamic systems The book presents valuable results concerning their state space transfer function and time domain representations which can be useful both for the open loop analysis as well as for the closed loop design The book is primarily intended to help professionals as well as undergraduate and postgraduate students involved in modeling and automatic control of dynamic systems
