Disease is suitable for patients wanting to adopt preventive measures at home and anyone wanting to better manage their heart health. It will be of great value to all health care practitioners, cardiologists, and dietitians. Nutritional and Metabolic Bases of Cardiovascular Disease Mario Mancini, Jose M. Ordovas, Gabrielle Riccardi, Paolo Rubba, Pasquale Strazzullo, 2011-07-11. Extraordinary advances in the understanding of the links between nutrition, metabolism, and cardiovascular disease have prompted a systematic reappraisal of knowledge in the field. As a result, it is now imperative that clinicians who care for patients with CVD or its key risk factors have a solid understanding of the often complex interrelationships between cardiovascular health and chronic diseases such as diabetes and obesity. Written by a team of international thought leaders in cardiology, endocrinology, diabetology, and nutritional science, this important new book examines and updates the role of obesity, hyperlipidemia, diabetes, hypertension, thrombosis, and aging in atherogenesis. Describes in detail the scientific and clinical evidence of the etiopathogenesis of ischemic heart disease as well as of peripheral and cerebrovascular disease. Focuses on the 6 topics that will be of greatest interest to readers: 1. general nutrition 2. metabolic syndrome and diabetes 3. hyperlipidemia and atherosclerosis 4. hypertension and cerebrovascular disease 5. hemostasis and thrombosis 6. aging. Throughout the book, in clear and accessible text, contributors illuminate the close relationship between dietary habits, the metabolic processes of nutrients, and their impact on the cardiovascular system, always with an eye on how the physician can use this information to implement better cardiovascular prevention and improve patient care. Nutritional and Metabolic Bases of Cardiovascular Disease is ideal for those who need to update their knowledge of the links between nutrition, metabolism, and CVD: from trainees, clinicians, and clinical investigators in cardiovascular medicine to endocrinologists, diabetologists, and nutritionists. Nutrition and Heart Disease Ronald Ross Watson, Victor R. Preedy, 2003-12-17. Heart disease is the primary cause of death and disability in Western countries. Research indicates that nutrition and diet play key roles in both preventing and causing many types of heart damage and dysfunction. By understanding the complex relationship between diet and disease, new prevention measures can be established, and millions of lives can be saved. **Heart Diseases: New Insights for the Healthcare Professional: 2011 Edition**, 2012-01-09. The papers explore the link between genetics and nutrition in the context of biological evolution. They provide examples of successful interaction between the two disciplines and consider some aspects of nutrient requirements as well as utilization and consideration of methodological approaches to evaluate nutritional status with an emphasis on malnutrition. Divided into six parts encompassing 29 chapters, this volume begins with an overview of genetics and nutrition from an evolutionary perspective, citing findings among Amerindians. It proceeds with a discussion of the potential application of genetic epidemiology in nutritional research, nutrient requirements and metabolism, the association between obesity and energy balance, and assessment of nutritional status. It also presents case studies of the correlation between genetics and nutrition before introducing the reader to genetic inheritance and growth in human groups suffering from chronic under nutrition. Some data derived from nutrition longitudinal studies are analyzed to interpret the nutrition genetics interaction. This book will be a valuable source of information for scientists and students in genetics and nutrition.

Genome-based Nutrition Strategies for Preventing Diet-related Chronic Diseases: Where Genes, Diet, and Food Culture Meet Arturo Panduro, Omar Ramos-Lopez, Claudia Ojeda-Granados, 2024-07-02 Human populations that have recently undergone substantial changes in their traditional social, cultural, and dietary habits have shown an increased susceptibility to developing chronic diet-related diseases concerning their genetic background. One factor is that the population's adaptive genetic variants related to its evolutionary history are exposed to different physical and lifestyle environments that underlie and influence the current patterns of disease risk. Under this perspective, the current obesogenic environment has promoted the acculturation of a westernized diet, disrupting the ancestral gene-foods, nutrients, bioactive compounds interactions, i.e., ancestral genetic/ethnic profile vs. modern lifestyle. Modern lifestyles, including unhealthy dietary patterns, have further impaired the consumption of staple foods with essential nutrients and functional properties, increasing the incidence of obesity and associated comorbidities. However, most conventional nutrition approaches targeting chronic diseases have limited impact on managing the leading non-communicable diseases affecting modern societies.

Evolutionary Aspects of Nutrition and Health A. P. Simopoulos, Berthold Koletzko, 1999-07 The issues treated in this publication are brought together in this way for the first time For many of the chronic diseases familial predispositions are well established and there is good evidence for true genetic predisposition When Homo erectus emerged 1 7 million years ago humans existed as non cereal eating hunter gatherers It is on this basis that according to the hypothesis of the carnivore connection an insulin resistant genotype evolved to provide survival and reproductive advantages to populations adapted to a high meat low plant food low carbohydrate nutritional environment Cereal became the major source of calories and protein in the human diet only about 10 000 years ago Humankind has thus had little evolutionary experience to adapt to this new food type maladaptation being the consequence Moreover studies comparing energy expenditure in Western societies and during the Paleolithic period indicate a low level of physical activity not previously encountered in human history a state to which humans are not genetically adapted Together with the dietary changes this has led to a modern environment in which a number of individuals are prone

to chronic diseases causing increases in non insulin dependent diabetes mellitus hypertension coronary artery disease cancer and obesity As a consequence the lifestyle approach for the prevention and management of these diseases is essential varying with national dietary patterns and national economy This publication will be of special interest to physicians geneticists nutritionists dieticians anthropologists food technologists food policy makers and individuals interested in personal and family health Controlling High Blood Pressure through Nutrition, Nutritional Supplements, Lifestyle, and Drugs Mark C.
