Fallat,Charles R. Johnson,2022-12-13 Totally nonnegative matrices arise in a remarkable variety of mathematical applications This book is a comprehensive and self contained study of the essential theory of totally nonnegative matrices defined by the nonnegativity of all subdeterminants It explores methodological background historical highlights of key ideas and specialized topics The book uses classical and ad hoc tools but a unifying theme is the elementary bidiagonal factorization which has emerged as the single most important tool for this particular class of matrices Recent work has shown that bidiagonal factorizations may be viewed in a succinct combinatorial way leading to many deep insights Despite slow development bidiagonal factorizations along with determinants now provide the dominant methodology for understanding total nonnegativity The remainder of the book treats important topics such as recognition of totally nonnegative or totally positive matrices variation diminution spectral properties determinantal inequalities Hadamard products and completion problems associated with totally nonnegative or totally positive matrices The book also contains sample applications an up to date bibliography a glossary of all symbols used an index and related references Mathematical Reviews ,2001 Multi-Layer Potentials and Boundary Problems Irina Mitrea,Marius Mitrea,2013-01-05 Many phenomena in engineering and mathematical physics can be modeled by means of boundary value problems for a certain elliptic differential operator in a given domain When the differential operator under discussion is of second order a variety of tools are available for dealing

with such problems including boundary integral methods variational methods harmonic measure techniques and methods based on classical harmonic analysis When the differential operator is of higher order as is the case e g with anisotropic plate bending when one deals with a fourth order operator only a few options could be successfully implemented In the 1970s Alberto Calderón one of the founders of the modern theory of Singular Integral Operators advocated the use of layer potentials for the treatment of higher order elliptic boundary value problems The present monograph represents the first systematic treatment based on this approach This research monograph lays for the first time the mathematical foundation aimed at solving boundary value problems for higher order elliptic operators in non smooth domains using the layer potential method and addresses a comprehensive range of topics dealing with elliptic boundary value problems in non smooth domains including layer potentials jump relations non tangential maximal function estimates multi traces and extensions boundary value problems with data in Whitney Lebesgue spaces Whitney Besov spaces Whitney Sobolev based Lebesgue spaces Whitney Triebel Lizorkin spaces Whitney Sobolev based Hardy spaces Whitney BMO and Whitney VMO spaces

Abstract Parabolic Evolution Equations and their Applications Atsushi Yagi, 2009-11-03 This monograph is intended to present the fundamentals of the theory of abstract parabolic evolution equations and to show how to apply to various nonlinear diffusion equations and systems arising in science The theory gives us a unified and systematic treatment for concrete nonlinear diffusion models Three main approaches are known to the abstract parabolic evolution equations namely the semigroup methods the variational methods and the methods of using operational equations In order to keep the volume of the monograph in reasonable length we will focus on the semigroup methods For other two approaches see the related references in Bibliography The semigroup methods which go back to the invention of the analytic semigroups in the middle of the last century are characterized by precise formulas representing the solutions of the Cauchy problem for evolution equations The analytic semigroup generated by a linear operator A provides directly a fundamental solution to the Cauchy problem for an autonomous linear evolution equation $u_t = Au$

Partial Differential Equations in Anisotropic Musielak-Orlicz Spaces Iwona Chlebicka, Piotr Gwiazda, Agnieszka Świerczewska-Gwiazda, Aneta Wróblewska-Kamińska, 2021-11-01 This book provides a detailed study of nonlinear partial differential equations satisfying certain nonstandard growth conditions which simultaneously extend polynomial inhomogeneous and fully anisotropic growth The common property of the many different kinds of equations considered is that the growth conditions of the highest order operators lead to a formulation of the equations in Musielak Orlicz spaces This high level of generality understood as full anisotropy and inhomogeneity requires new proof concepts and a generalization of the formalism calling for an extended functional analytic framework This theory is established in the first

part of the book which serves as an introduction to the subject but is also an important ingredient of the whole story The second part uses these theoretical tools for various types of PDEs including abstract and parabolic equations but also PDEs arising from fluid and solid mechanics For connoisseurs there is a short chapter on homogenization of elliptic PDEs The book will be of interest to researchers working in PDEs and in functional analysis
