

VITAMINS B AND D: ESSENTIAL NUTRIENTS FOR NERVE REPAIR

Vitamins B1, B6, and B12 are essential for proper nerve function and regeneration. Deficiencies in these vitamins are common in people with neuropathy, which can lead to increased symptoms like tingling and numbness. Including foods rich in B vitamins, such as whole grains, eggs, and lean meats, can significantly aid in nerve repair. Additionally, vitamin D, found in fatty fish, fortified foods, and sunlight exposure, is crucial for reducing nerve pain and supporting overall health.

Handbook of Drug-Nutrient Interactions Joseph I. Boullata, Vincent T. Armenti, 2004-04-17 Although there is a great deal of literature regarding drug nutrient interactions DNI there are limited sources of up to date comprehensive information The Handbook of Drug Nutrient Interactions admirably fills this gap The editors Dr Joseph I Boullata and Dr Vincent T Armenti have a wealth of experience in this therapeutic area and have assembled a fine cadre of chapter authors who have individually contributed their high level of expertise As treatment for many diseases becomes increasingly complex with multiple drug therapies scheduled at varying times the need to identify clinically significant DNIs is an essential part of medication

management This is a shared responsibility between health care professionals to interpret available data and individualize an approach to therapy that is compatible with the patient's disease state, life stage and dietary intake. Awareness of the significance of drug-food interactions is generally lacking. Although many texts contain lengthy lists of possible interactions, few data are provided for the clinician to gain an understanding of the mechanism of action of the interaction and subsequently apply the information to a particular patient or group of patients. For example, in the management of patients with HIV/AIDS who are taking complex prescribed drug regimens, herbal products and nutritional supplements, many of which are affected by dietary intake, careful attention to DNI is a critical component of therapy. Clinicians need to take account of not only the well-documented interactions between drugs and nutrients but also the less obvious effects on drug-nutrient disposition and metabolism.

mellitus is the 3rd leading cause of death if we were to include all secondary complications. However, without including secondary complications, it is 7th place in mortality and morbidity. The point to be considered in the case of diabetes mellitus is the secondary complications caused in this condition. Almost all organs are affected by diabetes, and results in a potentially worse condition. The major secondary complications are neuropathy, nephropathy, retinopathy, and diabetes foot microvascular and macrovascular complications. The long-term complications grow slowly in the case of diabetes. As the time living with diabetes becomes longer, controlled glucose levels will be more difficult to achieve, meaning there will be more long-term complications. The aim of the current Research Topic on the secondary complications of diabetes and their management is to publish good quality research articles as well as reviews which should address the management of diabetes abnormalities of secondary complications and other diseases involved in diabetes. Potential Topics include but are not restricted to: Secondary complications of diabetes mellitus; Microvascular and macrovascular complications; The role of oxidative stress in the diabetes burden; New insights in glycemic control; New strategies/approaches to manage secondary complications such as Stearoyl CoA dismutase, Acetyl CoA Carboxylase, Adiponectin, Adipocyte complement-related protein 30, Hormone Sensitive Lipase, HSL Inhibitors; Recent development in the therapeutic approaches for glucose management such as Protein tyrosine phosphatase 1B, PTP1B inhibitors, Glycogen synthase kinase 3, GSK3 inhibitors, 3 Adrenergic receptor agonist, Retinoid X receptor, PPAR agonist, AMP-activated protein kinase; Development of new target as a target for antihyperglycemic drug designing.
