R-Trees: Theory and Applications Yannis Manolopoulos, Alexandros Nanopoulos, Apostolos N. Papadopoulos, Yannis Theodoridis, 2010-09-08 Space support in databases poses new challenges in every part of a database management system the capability of spatial support in the physical layer is considered very important This has led to the design of spatial access methods to enable the effective efficient management of spatial objects R trees have a simplicity of structure together with their resemblance to the B tree allow developers to incorporate them easily into existing database management systems for the support of spatial query processing This book provides an extensive survey of the R tree evolution studying the applicability of the structure its variations to efficient query processing accurate proposed cost models implementation issues like concurrency control and parallelism Written for database researchers designers programmers as well as graduate students this comprehensive monograph will be a welcome addition to the field

3D Geoinformation Science Martin Breunig, Mulhim Al-Doori, Edgar Butwilowski, Paul V. Kuper, Joachim Benner, Karl Heinz Haefele, 2014-11-29 Nowadays 3D Geoinformation is needed for many planning and analysis tasks For example 3D city and infrastructure models are paving the way for complex environmental and noise analyzes 3D geological sub surface models are needed for reservoir exploration in the oil gas and geothermal industry Thus 3D Geoinformation brings together researchers and practitioners from different fields such as the geo sciences civil engineering 3D city modeling 3D geological and geophysical modeling and last but not least computer science The diverse challenges of 3D Geoinformation Science concern new approaches and the development of standards for above and under ground 3D modeling efficient 3D data management visualization and analysis Finally the integration of different 3D approaches and data models is seen as one of the most important challenges to be solved

Handbook of Data Structures and Applications Dinesh P. Mehta, Sartaj Sahni, 2004-10-28 Although there are many advanced and specialized texts and handbooks on algorithms until now there was no book that focused exclusively on the wide variety of data structures that have been reported in the literature The Handbook of Data Structures and Applications responds to the needs of students professionals and researchers who need a mainstream reference on data structures by providing a comprehensive survey of data structures of various types Divided into seven parts the text begins with a review of introductory material followed by a discussion of well known classes of data structures Priority Queues Dictionary Structures

and Multidimensional structures The editors next analyze miscellaneous data structures which are well known structures that elude easy classification The book then addresses mechanisms and tools that were developed to facilitate the use of data structures in real programs It concludes with an examination of the applications of data structures The Handbook is invaluable in suggesting new ideas for research in data structures and for revealing application contexts in which they can be deployed Practitioners devising algorithms will gain insight into organizing data allowing them to solve algorithmic problems more efficiently

Fixed Point Theory in Distance Spaces William Kirk, Naseer Shahzad, 2014-10-23 This is a monograph on fixed point theory covering the purely metric aspects of the theory particularly results that do not depend on any algebraic structure of the underlying space Traditionally a large body of metric fixed point theory has been couched in a functional analytic framework This aspect of the theory has been written about extensively There are four classical fixed point theorems against which metric extensions are usually checked These are respectively the Banach contraction mapping principal Nadler's well known set valued extension of that theorem the extension of Banach's theorem to nonexpansive mappings and Caristi's theorem These comparisons form a significant component of this book This book is divided into three parts Part I contains some aspects of the purely metric theory especially Caristi's theorem and a few of its many extensions There is also a discussion of nonexpansive mappings viewed in the context of logical foundations Part I also contains certain results in hyperconvex metric spaces and ultrametric spaces Part II treats fixed point theory in classes of spaces which in addition to having a metric structure also have geometric structure These specifically include the geodesic spaces length spaces and CAT 0 spaces Part III focuses on distance spaces that are not necessarily metric These include certain distance spaces which lie strictly between the class of semimetric spaces and the class of metric spaces in that they satisfy relaxed versions of the triangle inequality as well as other spaces whose distance properties do not fully satisfy the metric axioms
