Solution of the Incompressible Navier-Stokes Equations L. Quartapelle, 2013-03-07 This book presents different formulations of the equations governing incompressible viscous flows in the form needed for developing numerical solution procedures The conditions required to satisfy the no slip boundary conditions in the various formulations are discussed in detail Rather than focussing on a particular spatial discretization method the text provides a unitary view of several methods currently in use for the numerical solution of incompressible Navier Stokes equations using either finite differences finite elements or spectral approximations For each formulation a complete statement of the mathematical problem is provided comprising the various boundary possibly integral and initial conditions suitable for any theoretical and or computational development of the governing equations The text is suitable for courses in fluid mechanics and computational fluid dynamics It covers that part of the subject matter dealing with the equations for incompressible viscous flows and their determination by means of numerical methods A substantial portion of the book contains new results and unpublished material NASA Technical Memorandum United States. Schnittkowski, 2013-03-07 Herbert Hornlein Klaus Schittkowski The finite element method FEM has been used successfully for many years to simulate and analyse mechanical structural problems The results are accepted or rejected by means of comparison of state variables stresses displacements natural frequencies etc and user requirements In further analyses the design variables will be updated until the user specifications are met and the design is feasible This is the primary aim of the design process On this set of feasible designs the additional requirement given by an objective function e g weight stiffness

efficiency etc defines the structural optimization problem In recent years more and more finite element based analysis systems were extended and offer now optimization modules They proceed from the design model as defined for structural analysis to perform an internal adaption of design parameters based on formal mathematical methods Despite of many common features there are significant differences in the selected optimization strategy the current implementation and the numerical results

Transport Simulation in Microelectronics Alfred Kersch, William J. Morokoff, 2012-12-06 Computer simulation of semiconductor processing equipment and devices requires the use of a wide variety of numerical methods Of these methods the Monte Carlo approach is perhaps most fundamentally suited to modeling physical events occurring on microscopic scales which are intricately connected to the particle structure of nature Here physical phenomena can be simulated by following simulation particles such as electrons molecules photons etc through a statistical sampling of scattering events Monte Carlo is however generally looked on as a last resort due to the extremely slow convergence of these methods It is of interest then to examine when in microelectronics it is necessary to use Monte Carlo methods how such methods may be improved and what are the alternatives This book addresses three general areas of simulation which frequently arise in semiconductor modeling where Monte Carlo methods play a significant role In the first chapter the basic mathematical theory of the Boltzmann equation for particle transport is presented The following chapters are devoted to the modeling of the transport processes and the associated Monte Carlo methods Specific examples of industrial applications illustrate the effectiveness and importance of these methods Two of these areas concern simulation of physical particles which may be assigned a time dependent position and velocity This includes the molecules of a dilute gas used in such processing equipment as chemical vapor decomposition reactors and sputtering reactors We also consider charged particles moving within a semiconductor lattice

Mathematical Modelling and Simulation of Electrical Circuits

and Semiconductor Devices Randolph Bank, R. Bulirsch, H. Gajewski, K. Merten, 2012-12-06 Progress in today's high technology industries is strongly associated with the development of new mathematical tools. A typical illustration of this partnership is the mathematical modelling and numerical simulation of electric circuits and semiconductor devices. At the second Oberwolfach conference devoted to this important and timely field, scientists from around the world, mainly applied mathematicians and electrical engineers from industry and universities, presented their new results. Their contributions forming the body of this work cover electric circuit simulation, device simulation, and process simulation. Discussions on experiences with standard software packages and improvements of such packages are included. In the semiconductor area, special lectures were given on new modelling approaches, numerical techniques, and existence and uniqueness results. In this connection, mention is made, for example, of mixed finite element methods, an extension of the Baliga-Patankar technique for a three-dimensional simulation, and the connection between semiconductor equations and the Boltzmann equations.

Flow in Porous Media J. Douglas, U. Hornung, 2012-12-06 Jim Douglas Jr. These proceedings reflect some of the thoughts expressed at the Oberwolfach Conference on Porous Media held June 21-27, 1992, organized by Jim Douglas Jr., Ulrich Hornung, and Cornelius J. van Duijn. Forty-five scientists attended the conference, and about thirty papers were presented. Fourteen manuscripts were submitted for the proceedings and are incorporated in this volume; they cover a number of aspects of flow and transport in porous media. Indeed, there are 223 individual references in the fourteen papers, but fewer than fifteen are cited in more than one paper. The papers appear in alphabetical order on the basis of the first author. A brief introduction to each paper is given below. Allen and Curran consider a variety of questions related to the simulation of ground water contamination. Accurate water velocities are essential for acceptable results, and the authors apply mixed finite elements to the pressure equation to obtain these velocities. Since fine grids are required to resolve heterogeneities, standard iterative procedures are too slow for practical simulation; the authors introduce a parallelizable multigrid-based iterative scheme for the lowest order Raviart-Thomas mixed method. Contaminant transport is approximated through a finite element collocation procedure, and an alternating direction modified method of characteristics technique is employed to time step the simulation. Computational experiments were carried out on an nCube 2 computer.

Archives of Control Sciences, 1992 **Numerical Methods in Approximation Theory, Vol. 9** D. Braess, L.L. Schumaker, 2013-03-11 This book is the official proceedings of a conference on Numerical Methods in

Approximation Theory which was held at the Mathematisches Forschungsinstitut in Oberwolfach during the week of November 24-30, 1991. It contains refereed and edited papers by 20 of the 49 participants. The book is dedicated to the memory of Prof. Lothar Collatz who maintained a long and active interest in numerical approximation. It is the ninth in a series of volumes published by Birkhäuser resulting from conferences on the subject held at Oberwolfach and co-organized by Prof. Collatz. We now briefly describe the contents of the book. The paper of BASZEN, SKI, DELVOS and JESTER deals with blending using sine double series expansions of functions defined on the unit square. In addition to giving explicit error estimates for partial sums and for interpolating sine polynomials, they also show that Boolean sums yield almost the same asymptotic error estimates as the conventional tensor product approach but with a reduced number of terms. The paper of BEATSON and LIGHT discusses approximation by quasi-interpolants which are sums of scaled translates of a one-parameter family of functions. They do not require reproduction of low degree polynomials but nevertheless are able to give error bounds and analyze quasi-interpolation based on Gaussians and exponentials. BINEV and JETTER deal with multivariate interpolation using shifts of a single basis function. They treat both gridded data and scattered data. As examples, they consider box splines and certain radial basis functions.

Free Boundary Problems in Continuum Mechanics S.N. Antontsev, K.H. Hoffmann, A.M. Khludnev, 2013-03-07. Progress in different fields of mechanics such as filtration theory, elastic-plastic problems, crystallization processes, internal and surface waves etc. is governed to a great extent by the advances in the study of free boundary problems for nonlinear partial differential equations. Free boundary problems form a scientific area which attracts attention of many specialists in mathematics and mechanics. Increasing interest in the field has given rise to the International Conferences on Free Boundary Problems and Their Applications which have convened since the 1980s in such countries as England, the United States, Italy, France, and Germany. This book comprises the papers presented at the International Conference Free Boundary Problems in Continuum Mechanics organized by the Lavrentyev Institute of Hydrodynamics, Russian Academy of Sciences, July 15-19, 1991, Novosibirsk, Russia. The scientific committee consisted of Co-chairmen K.H. Hoffmann (Russia), L.V. Ovsiannikov (Russia), J. Ockendon (UK), M. Fremond (France), L. Ovsiannikov (Russia), A. Friedman (USA), S. Pokhozhaev (Russia), K.H. Hoffmann (Germany), M. Primicerio (Italy), A. Khludnev (Russia), V. Pukhnachov (Russia), V. Monakhov (Russia), Yu. Shokin (Russia), V. Teshukov (Russia). Our thanks are due to the members of the Scientific Committee, all authors and participants for contributing to the success of the Conference. We would like to express special appreciation to N. Makarenko, J. Mal'tseva, and T. Savelieva (Lavrentyev Institute of Hydrodynamics) for their help in preparing this book for publication.

Fluid-Structure Interaction and Biomedical Applications Tomáš Bodnár, Giovanni P. Galdi, Šárka Nečasová, 2014-10-13. This book presents in a methodical way updated and comprehensive descriptions and analyses of some of the most relevant problems in the context of fluid-structure interaction (FSI). Generally speaking, FSI is among the most popular and intriguing problems in applied sciences and includes industrial as well as
