

Number Field Sieve

An extremely fast factorization method developed by Pollard which was used to factor the [RSA-130 number](#). This method is the most powerful known for factoring general numbers, and has complexity

$$O\left\{\exp\left[c(\log n)^{1/3}(\log \log n)^{2/3}\right]\right\}, \quad (1)$$

reducing the exponent over the [continued fraction factorization algorithm](#) and [quadratic sieve](#). There are three values of c relevant to different flavors of the method (Pomerance 1996). For the "special" case of the algorithm applied to numbers near a large [power](#),

$$c = \left(\frac{32}{9}\right)^{1/3} = 1.526285 \dots, \quad (2)$$

for the "general" case applicable to any [odd positive](#) number which is not a [power](#),

$$c = \left(\frac{64}{9}\right)^{1/3} = 1.922999 \dots, \quad (3)$$

and for a version using many [polynomials](#) (Coppersmith 1993),

Number Field Sieve:

The Development of the Number Field Sieve Arjen K. Lenstra, Hendrik W. Jr. Lenstra, 2006-11-15 The number field sieve is an algorithm for finding the prime factors of large integers It depends on algebraic number theory Proposed by John Pollard in 1988 the method was used in 1990 to factor the ninth Fermat number a 155 digit integer The algorithm is most suited to numbers of a special form but there is a promising variant that applies in general This volume contains six research papers that describe the operation of the number field sieve from both theoretical and practical perspectives Pollard's original manuscript is included In addition there is an annotated bibliography of directly related literature *Pollard's Number Field Sieve* Alexander Shaumyan, 1998 The Number Field Sieve has revolutionized the field of computational number theory and enabled researchers to factor very large integers a task which seemed insurmountable with the best computers and the best factorization techniques that were available a few years earlier We ll illustrate how the Number Field Sieve works using various examples of factorizations in different number fields We ll also see how the method can be extended to factor any integer m not just a special m which can be written in the form $m = r^2 S$ for which the original algorithm was developed We ll look at the modified version of the Number Field Sieve known as the General Number Field Sieve GNFS and look at an example of a number factored with GNFS But in order to understand the process we need to introduce the concepts of algebraic number fields and algebraic numbers [The Development of the Number Field Sieve](#) Arjen K.
