The Genetics of Obesity Struan F.A. Grant, 2013-11-09 In the past four years many genetic loci have been implicated for BMI from the outcomes of genome wide association studies GWAS primarily in adults Insulin induced gene 2 INSIG2 was the first locus to be reported by this method to have a role in obesity but replication attempts have yielded inconsistent outcomes The identification of the second locus the fat mass and obesity associated gene FTO has been more robustly observed by others Studies from both FTO knock out and FTO overexpression mouse model support the fact that FTO is directly involved in the regulation of energy intake and metabolism in mice where the lack of FTO expression leads to leanness while enhanced expression of FTO leads to obesity Along with numerous other studies a number of genetic variants have been established robustly in the context of obesity giving us fresh insights into the pathogenesis of the disease This book will give a comprehensive overview of efforts aimed at uncovering genetic variants associated with obesity which have been particularly successful in the past 5 years with the advent of genome wide association studies GWAS This book will cover this state of the art technology and its application to obesity in great detail Topics covered will include genetics of childhood obesity genetics of syndromic obesity copy number variants and extreme obesity co morbidities of obesity genetics and functional follow up of genetic variants
