Fitzgibbon,Jamie Ward,2014-08-27 Everyday we vicariously experience a range of states that we observe in other people we may feel embarrassed when witnessing another making a social faux pas or we may feel sadness when we see a loved one upset In some cases this process appears to be implicit For instance observing pain in others may activate pain related neural processes but without generating an overt feeling of pain In other cases people report a more literal conscious sharing of affective or somatic states and this has sometimes been described as representing an extreme form of

empathy By contrast there appear to be some people who are limited in their ability to vicariously experience the states of others This may be the case in several psychiatric neurodevelopmental and personality disorders where deficits in interpersonal understanding are observed such as schizophrenia autism and psychopathy In recent decades neuroscientists have paid significant attention to the understanding of the social brain and the way in which neural processes govern our understanding of other people In this Research Topic we wish to contribute towards this understanding and ask for the submission of manuscripts focusing broadly on the neural underpinnings of vicarious experience This may include theoretical discussion case studies and empirical investigation using behavioural techniques electrophysiology brain stimulation and neuroimaging in both healthy and clinical populations Of specific interest will be the neural correlates of individual differences in traits such as empathy how we distinguish between ourselves and other people and the sensorimotor resonant mechanisms that may allow us to put ourselves in another's shoes
