*Pathophysiology of the Visual System* L. Maffei, 1981-08-31      Clinical Anatomy of the Visual System E-Book Lee Ann Remington, Denise Goodwin, 2004-11-30 Taking the place of the multiple texts traditionally needed to cover visual anatomy and physiology *Clinical Anatomy and Physiology of the Visual System* 3rd Edition dramatically lightens your load by providing one book that covers it all This concise well referenced resource contains information on the clinical anatomy of the eye its adnexa and visual pathways histologic information plus newly added content on physiology of the human ocular structures Vivid illustrations complement the text and provide clinical information on diseases and disorders that represent departures from normal clinical anatomy Comprehensive physiology coverage clarifies the integration between structure and function eliminating your need for multiple books on the anatomy and physiology of the visual system An emphasis on clinical application helps you better understand the processes that occur in disease and dysfunction Genetic information keeps you current with the latest developments in visual anatomy and physiology Full color illustrations throughout the text enhance your understanding of anatomical and clinical information UNIQUE Clinical Comment sections provide a solid foundation for recognizing and understanding clinical situations conditions diseases and treatments Photos of normal eye structures illustrate clinical appearance and demonstrate how appearance is directly related to structure Geriatric coverage including aging changes in ocular tissue and the visual pathway keeps you up to date with the expanding field of geriatric care UNIQUE Expert coverage written by an actual optometrist gives you a practical framework for recognizing and understanding clinical situations problems and treatments

**The Discovery of a Visual System** Adrian Horridge, 2019-05-23 This book is the only account of what honeybees actually see Bees detect some visual features such as edges and colours but there is no sign that they reconstruct patterns or put together features to form objects Bees detect motion but have no perception of what it is that moves and certainly they do not recognize things by their shapes Yet they clearly see well enough to fly and find food with a minute brain Bee vision is therefore relevant to the construction of simple artificial visual systems for example for mobile robots The surprising conclusion is that bee vision is adapted to the recognition of places not things In this volume Adrian Horridge also sets out the curious and contentious history of how bee vision came to be understood with an account of a century of neglect of old experimental results errors of interpretation sharp disagreements and failures of the scientific method The design of the experiments and the methods of making inferences from observations are also critically examined with the conclusion that scientists are often hesitant imperfect and misleading ignore the work of others and fail to consider alternative explanations The erratic path to understanding makes interesting reading for anyone with an interest in the workings of science but particularly those researching insect vision and invertebrate sensory systems

**Accommodation and Vergence Mechanisms in the Visual System** Ove Franzen, Hansn Richter, Lawrence Stark, 2000-01-01 This conference was instigated by a combination of factors The nature of the problem the

wide spread occupational epidemiology reported on eye symptoms and eye fatigue in the workplace and the organizers awareness of the complexity of the scientific and clinical bases of knowledge that might be usefully applied The introduction of new methods into system neurobiology provides new insights into how we receive and process information from the external world and act upon it New non invasive methods have opened the way to direct observation of the human brain in action Due particularly to the interaction between the visual and oculomotor requirements involved several clinical and scientific fields intersect when these issues are considered To provide clear vision the accommodative and pupillary mechanisms are used To maintain binocularity the vergence oculomotor system sensitive to fatigue must attain congruence with accommodative levels This accommodation vergence linkage was a focus of our symposium **Physiology of the**

**Integrative Functions and Comparative Data** H. Autrum, P. O. Bishop, V. Braitenberg, K. L. Chow, R. L. De Valois, R. B. Freeman, W. A. van de Grind, O.-J. Grüsser, U. Grüsser-Cornehl, R. Jung, W. R. Levick, H.-U. Lunkenheimer, D. M. MacKay, M. Snyder, J. Stone, N. J. Strausfeld, I. Thomas, 2012-12-06 The present volume covers the physiology of the visual system beyond the optic nerve It is a continuation of the two preceding parts on the photochemistry and the physiology of the eye and forms a bridge from them to the fourth part on visual psychophysics These fields have all developed as independent specialties and need integrating with each other The processing of visual information in the brain cannot be understood without some knowledge of the preceding mechanisms in the photoreceptor organs There are two fundamental reasons ontogenetic and functional why this is so 1 the retina of the vertebrate eye has developed from a specialized part of the brain 2 in processing their data the eyes follow physiological principles similar to the visual brain centres Peripheral and central functions should also be discussed in context with their final synthesis in subjective experience i e visual perception Microphysiology and ultramicroscopy have brought new insights into the neuronal basis of vision These investigations began in the periphery HARTLINE S pioneering experiments on single visual elements of Limulus in 1932 started a successful period of neuronal recordings which ascended from the retina to the highest centres in the visual brain In the last two decades modern electron microscopic techniques and photochemical investigations of single photoreceptors further contributed to vision research

**Biochemistry and Physiology of Visual Pigments** Helmut Langer, 2012-12-06 This book is a report of a four day Symposium on the Biochemistry and Physiology of Visual Pigments which took place immediately after the VIth International Congress on Photobiology held in Bochum Federal Republic of Germany in August 1972 This meeting which brought together about 50 investigators of various aspects of the visual process was devoted to the visual cells of both vertebrates and invertebrates Whereas the International Symposium on the Biochemistry of the Retina held at Nijmegen The Netherlands in 1968 had concentrated on vertebrate photoreceptors this Symposium dealt with invertebrate photoreceptors as well so that workers in each field could become acquainted with recent progress in the other area The papers presented at the

Symposium were divided into six main topics to each of which a half day session was devoted The six parts of this book following the introductory lecture essentially correspond to these sessions In addition to the invited contributions the volume contains a number of short communications by other participants and two contributions by invited participants who were unable to attend The volume closes as did the Symposium with a General Discussion prepared and moderated by S L BONTING in which an attempt was made to integrate various new findings and to reconcile certain points of disagreement
