Low Angles:

Low-Angle Radar Land Clutter J. Barrie Billingsley, 2002-04-01 A necessary reference for all radar engineers or analysts including many levels of managers advisors and decision makers in the U S and worldwide radar industry Directly useful in both military DOD and civilian FAA applications The result of 20 years of research at MIT Lincoln Lab this book is of the most significant technological consequence for the industry It actually solves the problem of low angle radar land clutter by showing the reader how to design and predict the performance of radars that operate in situations where land clutter prevalent Radar land clutter constitutes the unwanted radar echoes returned from the earth s surface that compete against and interfere with the desired echoes returned by targets such as aircraft and other moving and stationary targets The ability to accurately predict the effects of land clutter in surface radar has been an unsolved problem for many years This book is comprehensive in addressing the topic containing many interrelated results each important in its own right It unifies and integrates all the results so as to create a comprehensive innovative and unequalled work The results of this book directly enable the reader to predict land clutter effects in surface radar Modern military aircraft deliberately fly low to hide their presence from radars that are also dealing with land clutter Depending on the terrain the performance of the radar varies greatly from very good to very poor This book helps radar engineers provide accurate assessments of ground clutter thus bringing their ability to detect and operate against low flying aircraft to a much higher and much more consistent level

Investigation of the Effects of Leading-edge Chord-extensions and Fences in Combination with Leading-edge Flaps on the Aerodynamic Characteristics at Mach Numbers from 0.40 to 0.93 of a 45 Degree Sweptback Wing of Aspect Ratio 4 Kenneth P. Spreemann, 1957 This investigation was made to determine the effects of 6 degree full span and 3 degree partial span leading edge flaps in combination with chord extensions or fences on the aerodynamic characteristics of a wing fuselage configuration with a 45 degree sweptback wing of aspect ratio 4 taper ratio 0.3 and NACA 65A006 airfoil sections The investigation was made in the Langley high speed 7 by 10 foot tunnel over a Mach number range of 0.40 to 0.93 and an angle of attack range of about 2 degrees to 24 degrees Lift drag and pitching moment data were obtained for all configurations From overall considerations of stability and performance it appears that with the model of this investigation the 6 degree full span leading edge flaps in combination with the chord extension over the outboard 35 percent of the span with or without leading edge camber would be the most desirable configuration
