Global Seagrass Research Methods F.T. Short, R.G. Coles, 2001-11-06 This thorough and informative volume presents a set of detailed globally applicable techniques for seagrass research The book provides methods for all aspects of seagrass science from basic plant collection to statistical approaches and investigations of plant animal interaction The emphasis is on methods that are applicable in both developing and developed countries The importance of seagrasses in coastal and near shore environments and ultimately their contribution to the productivity of the world s oceans has become increasingly recognised over the last 40 years Seagrasses provide food for sea

turtles nearly 100 fish species waterfowl and for the marine mammals the manatee and dugong Seagrasses also support complex food webs by virtue of their physical structure and primary production and are well known for their role as breeding grounds and nurseries for important crustacean finfish and shell fish populations Seagrasses are the basis of an important detrital food chain The plants filter nutrients and contaminants from the water stabilise sediments and act as dampeners to wave action Seagrasses rank with coral reefs and mangroves as some of the world s most productive coastal habitat and strong linkages among these habitats make the loss of seagrasses a contributing factor in the degradation of the world s oceans Contributors from around the world provide up to date methods for comparable collection of ecological information from both temperate and tropical seagrass ecosystems

Marine Biodiversity of Costa Rica, Central America Ingo S. Wehrtmann, Jorge

Cortés, 2008-12-28 Life began in the sea and even today most of the deep diversity of the planet is marine. This is often forgotten especially in tropical countries like Costa Rica renowned for their rain forests and the multitude of life forms found therein. Thus this book focusing on marine diversity of Costa Rica is particularly welcome. How many marine species are there in Costa Rica? The authors report a total of 6 777 species or 3.5% of the world's total. Yet the vast majority of marine species have yet to be formally described. Recent estimates of the numbers of species on coral reefs range from 1.9 million so that the true number of marine species in Costa Rica is certainly far higher. In some groups the numbers are likely to be vastly higher because to date they have been so little studied. Only one species of nematode is reported despite the fact that it has been said that nematodes are the most diverse of all marine groups. In better studied groups such as mollusks and crustaceans reported numbers are in the thousands but even in these groups many species remain to be described. Indeed the task of describing marine species is daunting if there really are about 9 million marine species and Costa Rica has 3.5% of them then the total number would be over 300 000. Clearly so much remains to be done that new approaches are needed. Genetic methods have enormous promise in this regard.
