analytics management and applications Both fundamental insights and representative applications are provided This book is a timely and valuable resource for students researchers and seasoned practitioners in Big Data fields Hai Jin Huazhong University of Science and Technology China Big Data Management and Processing explores a range of big data related issues and their impact on the design of new computing systems The twenty one chapters were carefully selected and feature contributions from several outstanding researchers The book endeavors to strike a balance between theoretical and practical coverage of innovative problem solving techniques for a range of platforms It serves as a repository of paradigms technologies and applications that target different facets of big data computing systems The first part of the book explores energy and resource management issues as well as legal compliance and quality management for Big Data It covers In Memory computing and In Memory data grids as well as co scheduling for high performance computing applications The second part of the book includes comprehensive coverage of Hadoop and Spark along with security privacy and trust challenges and solutions The latter part of the book covers mining and clustering in Big Data and includes applications in genomics hospital big data processing and vehicular cloud computing The book also analyzes funding for Big Data projects

Non-Volatile Memory Database Management Systems Joy Arulraj,Andrew Pavlo,2022-06-01 This book explores the implications of non volatile memory NVM for database management systems DBMSs The advent of NVM will fundamentally change the dichotomy between volatile memory and durable storage in DBMSs These new NVM devices are almost as fast as volatile memory but all writes to them are persistent even after power loss Existing DBMSs are unable to take full advantage of this technology because their internal architectures are predicated on the assumption that memory is volatile With NVM many of the components of legacy DBMSs are unnecessary and will degrade the performance of data intensive applications We present the design and implementation of DBMS architectures that are explicitly tailored for NVM The book focuses on three aspects of a DBMS 1 logging and recovery 2 storage and buffer management and 3 indexing First we present a logging and recovery protocol that enables the DBMS to support near instantaneous recovery Second we propose a storage engine architecture and buffer management policy that leverages the durability and byte addressability properties of NVM to reduce data duplication and data migration Third the book presents the design of a range index tailored for NVM that is latch free yet simple to implement All together the work described in this book illustrates that rethinking the fundamental algorithms and data structures employed in a DBMS for NVM improves performance and availability reduces operational cost and simplifies software development
