Numerical Methods For Unconstrained Optimization:

Numerical Methods for Unconstrained Optimization and Nonlinear Equations J. E. Dennis, Jr., Robert B. Schnabel, 1996-12-01 This book has become the standard for a complete state of the art description of the methods for unconstrained optimization and systems of nonlinear equations Originally published in 1983 it provides information needed to understand both the theory and the practice of these methods and provides pseudocode for the problems The algorithms covered are all based on Newton's method or quasi Newton methods and the heart of the book is the material on computational methods for multidimensional unconstrained optimization and nonlinear equation problems The republication of this book by SIAM is driven by a continuing demand for specific and sound advice on how to solve real problems The level of presentation is consistent throughout with a good mix of examples and theory making it a valuable text at both the graduate and undergraduate level It has been praised as excellent for courses with approximately the same name as the book title and would also be useful as a supplemental text for a nonlinear programming or a numerical analysis course Many exercises are provided to illustrate and develop the ideas in the text A large appendix provides a mechanism for class projects and a reference for readers who want the details of the algorithms Practitioners may use this book for self study and reference For complete understanding readers should have a background in calculus and linear algebra The book does contain background material in multivariable calculus and numerical linear algebra

A Derivative-free Two Level Random Search Method for Unconstrained Optimization
Neculai Andrei, 2021-03-31 The book is intended for graduate students and researchers in mathematics computer science and operational research The book presents a new derivative free optimization method algorithm based on randomly generated trial points in specified domains and where the best ones are selected at each iteration by using a number of rules This method is different from many other well established methods presented in the literature and proves to be competitive for solving many unconstrained optimization problems with different structures and complexities with a relative large number of variables Intensive numerical experiments with 140 unconstrained optimization problems with up to 500 variables have shown that this approach is efficient and robust Structured into 4 chapters Chapter 1 is introductory Chapter 2 is dedicated to presenting a two level derivative free random search method for unconstrained optimization It is assumed that the minimizing function is continuous lower bounded and its minimum value is known Chapter 3 proves the convergence of the algorithm In Chapter 4 the numerical performances of the algorithm are shown for solving 140 unconstrained optimization problems out of which 16 are real applications This shows that the optimization process has two phases the reduction phase and the stalling one Finally the performances of the algorithm for solving a number of 30 large scale unconstrained optimization problems up to 500 variables are presented These numerical results show that this approach based on the two level random search method for unconstrained optimization is able to solve a large diversity of problems with different structures and complexities There are a number of open problems which refer to the following aspects the selection of the number of trial or the number of the local trial points the selection of the bounds of the domains where the trial points and the local trial points are randomly generated and a criterion for initiating the line search
