Wardlaw, Roger Parton, 1988-08-12 This book provides a comprehensive and integrated survey of pathogenesis and immunity in the disease pertussis or whooping cough The scope is wide covering issues from the molecular biology of Bordetella pertussis rough vaccine manufacture and testing to clinical medicine and epidemiology The book contains 21 chapters written by 31 international authorities and active researchers in the pertussis field The main emphasis is on recent developments in knowledge of pertussis disease and the properties of pertussis vaccine Each chapter contains a brief introduction for the nonspecialist Pulmonary Infections and Immunity Herman Chmel, Mauro Bendinelli, Herman Friedman, 2013-11-11 Presenting the basic concepts and clinical implications of respiratory infection with special emphasis on the role of the immune system the field's leading researchers contribute detailed chapters on most of the major pathogenic and opportunistic bacteria fungi and viruses Their work will stimulate new research by microbiologists and immunologists teach clinicians the interaction between microorganisms and the host and provide health professionals with information necessary to evaluate public health procedures Recent Developments in Prophylactic Immunization Francis J. Zucker, 2012-12-06 It has been said that never in the history of human progress has a better and cheaper method of preventing illness been developed than immunization This is well illustrated by the WHO Expanded Programme on Immunization EPI which in developing countries is now preventing nearly a million deaths annually from measles pertussis and neonatal tetanus and for which there is a commitment by the WHO and UNICEF to protect all children by immunization by the end of the decade This enormous undertaking will be facilitated by the rapid advances in molecular biology and recombinant DNA technology in the understanding of immunological mechanisms and by the production and application of monoclonal antibodies so that the structure and location of important antigenic determinants or epitopes can be determined Chemical synthesis of oligopeptides has been simplified and computer programmes and X ray crystallography provide the tools for the determination of three dimensional structure of proteins so that the structure and location of important antigenic determinants or epitopes can be predicted These techniques have opened the way to the improvement of existing vaccines and to the development and production of new vaccines against infections for which vaccines are not available New vaccines under development include vaccines against hepatitis B hepatitis A malaria vaccines for typhoid cholera rota virus infection and other diarrhoeal diseases leprosy rabies the acquired immune deficiency syndrome AIDS rubella EB virus schistosomiasis and other infections These recent developments are discussed in the volume by internationally recognized experts assembled from several countries Feigin and Cherry's Textbook of Pediatric Infectious Diseases - E-Book James Cherry, Sheldon L.
