Animals have been used to model diseases or test new treatments since around 300 BC and undoubtedly our ability to model disease in animals including transgenic animals has provided major breakthroughs in all fields of biomedical research Due to their complexity and plurality of pathology and symptomatology the study of neurodegenerative diseases relies heavily on animal models These models have been developed in many species in the attempt to undercover the complex nature of the disease mechanisms involved The ultimate goal is to test promising therapies and to manage prevent or cure neurodegenerative disease But because most animal models in this area do not reproduce the full phenotypical disease spectrum and the etiology and clinical presentation of neurodegenerative diseases differ from one patient to the next the testing of these diseases in animal models often translates poorly to indices of efficacy when applied to the clinical population Written by experts in the field with these advances and challenges in mind this handbook provides an updated overview of the animal models being developed and used to study complex disease dynamics The first part of the book presents an overview of animal models of various species and includes a review of new invertebrate animal models to study neurodegeneration The second section presents the use of animal models to pinpoint disease mechanisms and the last part of the handbook examines the various therapeutic interventions being used in models of neurodegenerative disease     *Beta-secretase Transgenic Mice* Matthew J. Chiocco,2005     *Animal Models for Neurodegenerative Disease* Jesus Avila,Jose J Lucas,Felix Hernandez,2011-05-30

In recent years medical developments have resulted in an increase in human life expectancy Some developed countries now have a larger population of individuals aged over 64 than those under 14 One consequence of the ageing population is a higher incidence of certain neurodegenerative disorders In order to prevent these we need to learn more about them This book provides up to date information on the use of transgenic mouse models in the study of neurodegenerative disorders such as Alzheimer s and Huntington s disease By reproducing some of the pathological aspects of the diseases these studies could reveal the mechanism for their onset or development Some of the transgenic mice can also be used as targets for testing new compounds with the potential to prevent or combat these disorders The editors have extensive knowledge and experience in this field and the book is aimed

at undergraduates postgraduates and academics The chapters cover disorders including Alzheimer s disease Parkinson s disease Huntington s and other CAG diseases amyotrophic lateral sclerosis ALS recessive ataxias disease caused by prions and ischemia
