Roots Of Competitiveness:

Agroforestry: Science, Policy and Practice Fergus L. Sinclair, 2013-03-09 Agroforestry research is central to developing methods for the sustainable use of natural renewable resources evolving to address the needs of the coming century. It is now necessary to consolidate the scientific gains now being made in process oriented research and to develop a policy framework to encourage the adoption of sustainable land use practices. Agroforestry plays an important role in conserving forest resources reducing the need for deforestation. Further if forest is broadly defined as tree cover agroforestry will also increase the proportion of woody biomass in farming landscapes. The papers selected for inclusion in Agroforestry Science Policy and Practice establish agroforestry as an interdisciplinary science focused on the practical imperative of assisting farmers, forest dwellers and landscape level planners to achieve sustainable food, fuel and timber production into the 21st century.

Potentials and Limitations of Ecosystem Analysis Ernst-Detlef Schulze, Helmut Zwölfer, 2012-12-06 The identification of inputs and outputs is the first and probably most important step in testing and analyzing complex systems Following accepted natural laws such as the conservation of mass and the principle of electroneutrality the input output analysis of the system be it steady or in connection with perturbations will reveal the status dynamic will identify whether changes are reversible or irreversible and whether changing the input will cause a hysteresis response Moreover measurements of input and output fluxes can indicate the storage capacity of a system its resilience to buffer or amplify variations of the external input and it can identify structural changes Therefore to a certain extent the input output analysis can facilitate predictions about the ecosystem stability The measurement of fluxes and the determination of inputs and outputs of eco systems are in many aspects analogous to measurements done by engineers when testing an electronic apparatus The first step is the measurement of the input output properties of the instrument as a whole or of various circuit boards and the comparison of these with the expected variations of the original design Varying input and output can give valuable information about the stability and the regulatory properties of the device Nevertheless only the circuit as an entity has specific properties which cannot be anticipated if the individual components are investigated regardless of their position Also the instrument as a whole will have different input output properties than its subcircuits
