8. Explain how the hot spot shown in the diagram above created the Hawaiian Islands. Draw an arrow on the diagram to help explain the process.

Building Vocabulary

Answer the following questions on a separate sheet of paper.

9. What is the difference between magma and lava?

Figure 1
Diagram of Converging Boundaries
Converging plate boundaries form where two oceanic plates collide or where an oceanic plate collides with a continental plate. In both situations, an oceanic plate sinks beneath a trench. Heat from the sink causes the magma, which then erupts, to form volcanoes.

Converging Boundaries Most major plate boundaries where oceanic plates collide. Volcanoes may form where an oceanic plate collides with a continental plate.

Many volcanoes occur where plates collide. Through collisions, magma is forced toward a deep trench. The magma then rises through the rock above the subducting plate to form volcanoes. Because the magma is less dense than the surrounding rock, it rises toward the surface. Eventually, the magma breaks through the ocean floor, creating volcanoes.

The resulting volcanoes create a string of islands called an island arc. The curve of an island arc follows the curve of its deep-ocean trench. Major island arcs include Japan, New Zealand, Indonesia, the Philippines, the Aleutians, and the Caribbean Islands.

Volcanoes also occur where an oceanic plate is subducted beneath a continental plate. Collisions of this type produced the volcanoes of the Andes Mountains in South America and the volcanoes of the Pacific Northwest in the United States.

Figure 2 How did the volcanoes in the Andes Mountains form?
