Moving Target:

Optimal Search for Moving Targets Lawrence D. Stone, Johannes O. Royset, Alan R. Washburn, 2016-04-06 This book begins with a review of basic results in optimal search for a stationary target. It then develops the theory of optimal search for a moving target providing algorithms for computing optimal plans and examples of their use. Next it develops methods for computing optimal search plans involving multiple targets and multiple searchers with realistic operational constraints on search movement. These results assume that the target does not react to the search. In the final chapter there is a brief overview of mostly military problems where the target tries to avoid being found as well as rescue or rendezvous problems where the target and the searcher cooperate. Larry Stone wrote his definitive book *Theory of Optimal Search* in 1975 dealing almost exclusively with the stationary target search problem. Since then the theory has advanced to encompass search for targets that move even as the search proceeds and computers have developed sufficient capability to employ the improved theory. In this book Stone joins Royset and Washburn to document and explain this expanded theory of search. The problem of how to search for moving targets arises every day in military rescue, law enforcement and border patrol operations. *An Airborne Radar Technique for Moving-target Detection, Location, and Tracking* John K. Schindler, 1973 A novel technique for detecting, locating and tracking moving targets from an airborne radar platform is described and analyzed. The technique uses the generally dissimilar linear doppler frequency modulated signals from moving targets and stationary ground clutter. A matched filter processor is defined and its resolution and ambiguity properties studied as function processor parameters. Sub-clutter visibility of the processor is then determined. Two techniques for digitally implementing the processor are discussed and the computational efficiencies briefly analyzed. Finally target angular position can be determined using phase monopulse. It is then shown that target velocity, both ground speed and target heading, can be determined from radar observables. Author

Study on Ground Moving Target Indication and Imaging Technique of Airborne SAR Jian Yang, 2017-01-09 Based on a detailed analysis of the signal model of the moving target, this thesis focuses on the theories and applications of ground moving target indicator GMTI and ground moving target imaging GMTIm algorithms in synthetic aperture radar ground moving target indicator SAR GMTI mode, wide area surveillance ground moving target indication WAS GMTI mode and frequency modulated continuous wave synthetic aperture radar FMCW SAR systems. The proposed algorithms can not only indicate and image fast moving targets but are also effective in the context of slow moving target processing. The system design scheme combines the mechanical scanning mode and the airborne SAR system while the azimuth moving target indication algorithm employs the additional range walk migration induced by FMCW SAR systems. In addition, the non-ideal errors that deteriorate the performance of GMTIm algorithms in real SAR data processing are discussed and suitable compensation methods are provided. *Earth Observation Satellites* Hao Chen, Shuang Peng, Chun Du, Jun Li, 2023-09-04 This book highlights the practical models and algorithms of earth observation satellite EOS task scheduling. EOS task

scheduling is a typical complex combinatorial optimization problem with NP Hard computational complexity It is a key technology in aerospace scheduling and has attracted global attention Based on the actual needs of the EOS operation control center the book summarizes and reviews the state of the art in this research and engineering field In both deterministic scenarios and dynamic scenarios the book elaborates on the typical models algorithms and systems in centralized distributed and onboard autonomous task scheduling The book also makes an outlook on the promising technologies for EOS task planning and scheduling in the future It is a valuable reference for professionals researchers and students in satellite related technology This book is a translation of an original Chinese edition The translation was done with the help of artificial intelligence A subsequent human revision was done primarily in terms of content so that the book will read stylistically differently from a conventional translation
