Handbook of Plant Science, 2 Volume Set Keith Roberts, 2007-12-10 Plant Science like the biological sciences in general has undergone seismic shifts in the last thirty or so years. Of course science is always changing and metamorphosing but these shifts have meant that modern plant science has moved away from its previous more agricultural and botanical context to become a core biological discipline in its own right. However the sheer amount of information that is accumulating about plant science and the difficulty of grasping it all understanding it and evaluating it intelligently has never been harder for the new generation of plant scientists or for that matter established scientists. And that is precisely why this Handbook of Plant Science has been put together. Discover modern molecular plant sciences as they link traditional disciplines. Derived from the acclaimed Encyclopedia of Life Sciences. Thorough reference of up to the minute reliable self contained peer reviewed articles cross referenced throughout. Contains 255 articles and 48 full colour pages written by top scientists in each field. The Handbook of Plant Science is an authoritative source of up to date practical information for all teachers students and researchers working in the field of plant science botany plant biotechnology agriculture and horticulture. *Handbook of Proteolytic Enzymes, Volume 1* Alan J. Barrett, J. Fred Woessner, Neil D. Rawlings, 2012-12-02 Handbook of Proteolytic Enzymes Second Edition Volume 1 Aspartic and Metallo Peptidases is a compilation of numerous progressive research studies on proteolytic enzymes. This edition is organized into two main sections encompassing 328 chapters. This handbook is organized around a system for the classification of peptidases which is a hierarchical one built on the concepts of catalytic type clan family and peptidase. The concept of catalytic type of a peptidase depends upon the chemical nature of the groups responsible for catalysis. The recognized catalytic types are aspartic cysteine metallo serine threonine and the unclassified enzymes while clans and families are groups of homologous peptidases. Homology at the level of a family of peptidases is shown by statistically significant relationship in amino acid sequence to a representative member called the type example or to another member of the family that has already been shown to be related to the type example. Each chapter discusses the history activity specificity structural chemistry preparation and biological aspects of the enzyme. This book will prove useful to enzyme chemists and researchers. Senescence and Aging in Plants L.D. Nooden, 2012-12-02 Senescence and Aging in Plants reviews the state of knowledge in the processes involved in plant senescence and aging. The book begins by discussing the emergence of senescence as a concept experimental analysis of senescence and patterns of senescence. It then examines membrane deterioration during senescence photosynthesis in relation to leaf senescence senescence of detached plant organs changing patterns of nucleic acid and protein synthesis during senescence and degradative and associated assimilatory aspects of nitrogen removal. This is followed by chapters on aspects of ethylene that may impinge upon its role in promoting senescence of higher plants the role of cytokinins in plant senescence the promoters and retardants of senescence and the role of calcium in plant senescence. The concept of whole plant senescence is discussed which can be subdivided into

patterns correlative controls cessation of vegetative growth declining assimilatory processes assimilate partitioning and hormonal controls The final chapters cover the deterioration of cellular membranes during the plant aging process and seed aging

Therapeutic Use of Medicinal Plants and their Extracts: Volume 2 A.N.M. Alamgir, 2018-06-23 This book starts with a general introduction to phytochemistry followed by chapters on plant constituents their origins and chemistry but also discussing animal microorganism and mineral based drugs Further chapters cover vitamins food additives and excipients as well as xenobiotics and poisons The book also explores the herbal approach to disease management and molecular pharmacognosy and introduces methods of qualitative and quantitative analysis of plant constituents

Phytochemicals are classified as primary e.g. carbohydrates lipids amino acid derivations etc or secondary e.g. alkaloids terpenes and terpenoids phenolic compounds glycosides etc metabolites according to their metabolic route of origin chemical structure and function A wide variety of primary and secondary phytochemicals are present in medicinal plants some of which are active phytomedicines and some of which are pharmaceutical excipients

Biochemical and Cellular Mechanisms of Stress Tolerance in Plants Joe H. Cherry, 2013-06-29 Environmental stresses such as high and low temperature salinity and drought represent limiting factors to agricultural productivity worldwide Their impact is not only on crops that are presently being cultivated but they are also significant barriers to the introduction of crop plants into noncultivated areas The book describes the cellular biochemical and molecular mechanisms in plants that regulate tolerance to stresses Also discussed are prospects of engineering stress tolerant plants through the modification of germplasm

Crop Resistance Mechanisms to Alleviate Climate Change-Related Stress Jose Ramon Acosta Motos, Juan De Dios Franco-Navarro, Sara Álvarez, María José Gómez-Bellot, 2024-02-20 Anthropogenic activities have aggravated the effects of global climate change on ecosystems Plants because of their inability to escape from an adverse environment suffer to a great extent from stresses which can negatively impact their growth and development Global warming is increasingly causing extreme climatic situations such as very high or low temperatures drought and flooding events hailstorms wildfires extreme precipitation events and the reduction of fertile soil through desertification and salinization In addition warmer temperatures and higher humidity related with the climate change can also increase pest and disease pressure on plants by altering the geographic range population size and timing of pest and disease outbreaks Taken together abiotic stress related with climate change as drought or extreme temperature can exacerbate the spread and severity of various diseases associated with biotic stress increasing the vulnerability of plants to pathogens some examples include insects fungi bacteria
