Khan, Yezhang Ding , Mehanathan Muthamilarasan, 2025-01-31 The scientific community is currently focusing on climate resilience to ensure food and nutritional security Understanding the molecular mechanisms underlying stress response is the key to tweaking the key regulators for enhancing this trait Climate resilience is a dynamic process controlled by transcriptional and epigenetic regulators Therefore it is imperative to study transcriptional changes and epigenetic modifications regulating stress responses and manipulate candidate genes alleles

QTLs mQTLs to achieve biotic and abiotic stress resilience To recognize the full landscape of variations driving these phenotypic changes multi omics approaches must be used to understand these factors along with genetic variations To feed the ever growing population and tackle the uncertainties in environmental changes deploying genomics and sequencing is a viable solution Plant cells must modify their chromatin states and adjust their transcriptional profile to respond better to environmental stimuli These chromatin modifications include DNA methylation histone variants post transcriptional histone modifications and variations in non coding RNA activities Exploring transcriptional dynamics and epigenetic changes simultaneously with the natural variations present in the population sub population is necessary This will provide us with a full picture of different mechanisms driving the phenotypic changes and will help in developing better resilient varieties by utilizing this multi omics driven knowledge
