

Adding a loudspeaker

Using our radio with an earpiece means, of course, that only one person at a time can hear the programme. A loudspeaker changes electrical waves into sound waves in the same way that an earpiece does, but it has a large cardboard cone so that several people can hear the sound. Loudspeakers can have very large cones, but a smaller cone speaker with a diameter of 3 inches is ideal for our purpose.

Loudspeakers are made with inputs of varying resistances, and our radio requires a 3 or 5 Ω type. Unfortunately the loudspeaker cannot directly replace the earpiece because its resistance is much lower than that of the earpiece, so it has to be matched into the circuit with a transformer. A transformer can change a current of one voltage to a smaller current of a higher voltage or to a larger current of a smaller voltage. It consists of a 'primary' and 'secondary' winding of fine wire round a metal 'former'. The transformer we require is the Eagle LT700. This transformer has rather long leads, and these may be shortened by winding them tightly round a knitting needle. This makes spiral leads which can then be pulled out to reach the screws.

Screw the transformer onto the base, as shown; remove the 2.7K resistor across G and H and connect the correct leads (colour coded) to the screwcaps. Two more screwcaps are added at the end of the board to connect the output leads to the loudspeaker, using two small crocodile clips.
