Pediatric Oncology J. Robert Cassady, 2012-12-06 The diagnosis of cancer in a child is a devastating finding not only to the parents but often to the child. Even though the situation is relatively easy to accept among adults it is difficult to accept among children because of their general helpless state. The advances that have been made in the management of a child with cancer in the last 20 years have been dramatic in character. These have occurred not only by virtue of the contributions from early diagnosis and more precise staging but also from the contributions made by surgery, radiation therapy and the more widespread utilization of chemotherapy regimens. This volume by J Robert Cassady sets forth the position of radiation oncology in the management of the child with cancer. Radiation therapy remains an important and significant part of the treatment of this group of diseases. The book presents the basic knowledge with regards to pediatric oncology and how it relates to radiation therapy. It gives a timely overview on the topic and is essential for all radiation oncologists involved in the management of children with cancer. Hamburg Philadelphia June 1994 H P HEILMANN LUTHER W BRADY Preface This book provides a thorough review of the role that radiation therapy currently plays in the management of most childhood tumors. Extensively augmented with figures and tables where appropriate it also provides a concise review of current diagnostic and therapeutic approaches for major childhood malignancies. Extensive and up to date reference lists are an added benefit. **Pediatric Radiation Oncology** Louis S. Constine, Nancy J. Supportive Care of Children with Cancer Children's Oncology Group, 2004-04-05 Three of every four children and adolescents with cancer can now be cured. However, physicians are using increasingly intensive treatment regimens. These treatments can expose patients to toxic chemotherapeutic agents, invasive surgical procedures, and radiation oncology interventions that risk disfigurement, neuropsychiatric damage, and life threatening organ toxicity. These potentially dire consequences have mandated that advances in cancer treatment go hand in hand with supportive care measures that sustain patients through their therapeutic ordeal and allow each patient to achieve maximum quality of life. In this book, now in its third edition, the discipline of supportive care in pediatric oncology is covered in depth. *Supportive Care of Children with Cancer* is a ready reference.

Pediatric Cancer Survivors Karen Wonders,Brittany Stout,2017-06-07 Pediatric cancer develops in 1 to 500 children Typically the type of cancers that develop in children is different than those that develop in adults in that they are often the result of a DNA mutation rather than environmental or lifestyle risk factors Leukemia brain and central nervous system tumors and neuroblastomas are the most common cancer types in child populations Children tend to respond better to anticancer treatments including chemotherapy and radiation However long term side effects are common in children often requiring follow up care and lifestyle intervention for the rest of their lives The percentage of 5 year survivors was over 50% for the most common cancers This suggests that a majority of cancers in this population are highly survivable As such research should focus on aspects of survivorship for these individuals This book will explore issues related to pediatric cancer and their associated treatments
