

The effects on the blood cells of animals and man from exposure to single doses of whole-body radiation delivered over a short period of time (<24 hr) have been studied extensively. Observations of effects in man have been made on Japanese atomic-bomb victims [Liebow *et al.*, 1949; LeRoy, 1950]; the Marshallese natives exposed to fallout radiation [Cronkite *et al.*, 1955; Conard and Hicking, 1965]; reactor and criticality accident cases [Hempelmann *et al.*, 1952; Guskova and Baisogolov, 1956; Hasterlik and Marinelli, 1956; Brucer, 1959; Jammet *et al.*, 1959; Thoma and Wald, 1959; Bond *et al.*, 1960; Shipman *et al.*, 1961]; therapeutically irradiated cancer patients [Miller *et al.*, 1958]; and patients exposed for other medical reasons [Tubiana *et al.*, 1961; Hamburger *et al.*, 1962; Kuss *et al.*, 1962; Wald *et al.*, 1962]. The majority of these studies have consisted of observations of effects on the number of formed elements in the peripheral blood (hematological effects) as an index of severity of exposure. In recent years such studies have been extended to effects on the bone marrow directly and to production of chromosomal aberrations in somatic cells, usually by means of cell-culturing methods.

#### NATURE OF HEMATOLOGICAL SYNDROME

Hematological responses to radiation are largely dependent on damage to the bone marrow. The blood-forming marrow is encased in bone, the amount varying from one bone to the other; the ribs, vertebral column, and pelvic bones contain the greatest amount. The role of the lymphatic tissues (outside the bone marrow), which furnish lymphocytes to the blood, is not well understood, but lymphocytes are not considered as important to survival as are the bone-marrow cells. The degree of radiation damage to the bone marrow is reflected in peripheral blood counts. Lowering of levels of peripheral blood elements, therefore, is brought about largely by damage to the formative cells of the bone marrow and to the cells of the lymphatic tissues. Inhibition of cell division and cytological damage in the bone marrow can be seen shortly after irradiation. Heineke, as early as 1905, described destruction of bone-marrow cells following irradiation [Heineke, 1905]; since that time such changes have been well documented [Dunlap, 1942]. Fliedner *et al.* [1959] have reported such findings in the Oak Ridge Y-12 criticality accident victims. Damage to the genetic apparatus of the cells (i.e., the chromosomes) was evident with inhibition of cell
