

# STEREOTACTIC RADIOTHERAPY OF RECURRENT MALIGNANT GLIOMAS

Clinical White Paper

Tumors of the central nervous system (CNS) represent approximately 175,000 newly diagnosed cases worldwide per year, with an estimated annual mortality of 125,000<sup>1,2</sup>. Malignant gliomas comprise 30% of all primary CNS tumors and remain one of the greatest challenges in oncology today, despite access to state-of-the-art surgery, imaging, radiotherapy and chemotherapy<sup>3</sup>.

Figure: Details of a typical malignant glioma treatment plan

Signs and symptoms of malignant gliomas depend on the location, size and growth of the tumor and may include headaches, seizures, focal neurologic deficits and changes in mental status<sup>4</sup>. Both the tumor and its treatment often result in profound quality of life changes. Early failure of local treatment is common with this disease and relapse occurs in form of continuous growth close to the margin of the original lesion in approximately 80% of all cases<sup>5</sup>.

The World Health Organization classification system is predominantly used for naming and grading malignant gliomas; within this system, grade III astrocytomas and grade IV glioblastoma multiforme (GBM) are the most prevalent types with poor prognosis<sup>6</sup>. For glioblastoma, median survival time is limited to approximately 12 – 17 months<sup>7</sup>.

Although malignant gliomas are incurable in the vast majority of patients, surgery and radiotherapy are the traditional cornerstones of initial therapy protocols and provide palliative survival benefit<sup>8,9</sup>. Surgical techniques remain an important tool for glioma management, with complete surgical resection as the goal<sup>10</sup>.

Regardless of the degree of resection, adjuvant radiotherapy is administered after surgery. In early randomized studies, significant increases in survival were achieved in patients with high-grade gliomas with the administration of 50 – 60 Gy of whole brain radiotherapy following surgery<sup>11,12</sup>. Adjuvant chemotherapy is also used in the initial treatment of high-grade gliomas, with increased survival recently demonstrated in clinical trials<sup>13,14</sup>.

The vast majority of gliomas recur within or adjacent to the original tumor bed<sup>15</sup>. Treatment options for recurrent gliomas are limited because most therapeutic alternatives have already been performed, including neurosurgery and a full course of radiotherapy and chemotherapy. Optimal surgical resection might be possible in a subgroup of patients; however, it is accompanied by a high risk of morbidity because of the infiltrative nature of the tumor<sup>16</sup>. Conventional radiotherapy alternatives are often limited with respect to dose prescription because radiotherapy is already a component of first-line therapy in most patients.

Stereotactic radiosurgery (SRS) is appealing because of its ability to precisely deliver high doses of irradiation to a defined target volume in a single fraction with less treatment-associated morbidity compared with surgery<sup>17</sup>. However, SRS is limited to smaller lesions and low doses, as the risk of radiation-induced side effects rises with increasing treatment volume and dose<sup>18</sup>. Fractionated stereotactic radiotherapy (FSRT) enables the precise application of radiotherapy to a defined target volume while exploiting the radiobiologic advantage of fractionation and minimizing the risk for severe radiation-induced side effects<sup>19,20</sup>.

Combining FSRT with chemotherapy further increases high-grade recurrent glioma treatment efficiency. For recurrent GBM, temozolomide has been shown to improve quality of life and progression-free survival<sup>21</sup>.

An overview of the recent literature on hypofractionated FSRT treatments for recurrent malignant gliomas is presented in the table below.

## **Radiotherapy Of Malignant Disease:**

The Radiotherapy of Malignant Disease R.C.S. Pointon, 2012-12-06 Radiotherapy as practiced at the renowned Christie Hospital and Holt Radium Institute is brought up to date in this new second edition of *The Radiotherapy of Malignant Disease*. The contributions are all written by current or former members of the hospital staff. The opening chapters provide the necessary background information: basic physics and radiobiology, principles of chemotherapy and mould room practice. The main part of the book represents the very essence of the Manchester school of thought. It is designed to show in detail how to treat by X rays and radium malignant tumors in various anatomical sites. The book thus gives practical guidance on clinical techniques necessary in all disciplines involved in the management of malignant disease. From the reviews of the first edition: It should be in the library of every radiotherapy department and in the hands of every trainee. *British Medical Journal* 1. This book should be an important and interesting reference book on the shelves of any medical library or radiotherapist's office. *American Journal of Roentgenology* 2. There can be few established radiotherapists described by the editors as the epitome of the oncologist who did not read the earlier versions of the Manchester textbook and may still use it for reference. This latest edition is costly but it should continue to be read by all trainees aspiring to the DMRT and FRCR wherever they may be in training and whatever the philosophy of their teachers. *Journal of the Royal Society of Medicine* 3.

**The Radiotherapy of Malignant Disease** E.C. Easson, R.C.S. Pointon, 2012-12-06 Radiotherapy or radiation therapeutics as the name suggests is a branch of general therapeutics. In this case the therapeutic agent is ionising radiation which induces specific and predictable biological changes. Radiotherapy is sometimes described as therapeutic radiology because historically the earliest X ray machines were used both for diagnostic and therapeutic purposes. Diagnostic radiology has since become a very complex and time consuming speciality requiring the undivided care and attention of the diagnostic radiologist. Similarly radiotherapy now embraces both X ray beams and the radiations from radium and various artificial radium substitutes. This too requires the full time attention of the radiotherapist. In recent years radiotherapy has sometimes been described as radiotherapeutic oncology to indicate the involvement of the radiotherapist in oncological management and indeed in all aspects of oncology from prevention and early detection to the treatment after care and for those who need it terminal care of the patient. The radiotherapist by total commitment to the cancer problem is in truth the epitome of the oncologist. In the same way as the medical physician or internist requires a proper understanding of the pharmacology of the therapeutic agents he or she employs the nature metabolic biochemistry and biological effects of any administered drug so also the radiotherapist needs to understand the nature biological effects and therapeutic potentialities of ionising radiations. The radiotherapist's pharmacology involves an understanding of the relevant physics and radiobiology.
