Temperate and Boreal Rainforests of the World Dominick A. DellaSala, 2011 Temperate rainforests are biogeographically unique Compared to their tropical counterparts temperate rainforests are rarer and are found disproportionately along coastlines Because most temperate rainforests are marked by the intersection of marine terrestrial and freshwater systems these rich ecotones are among the most productive regions on Earth Globally temperate rainforests store vast amounts of carbon provide habitat for scores of rare and endemic species with ancient affinities and sustain complex food web dynamics In spite of their global significance however protection levels for these ecosystems are far too low to sustain temperate rainforests under a rapidly changing global climate and ever expanding human footprint Therefore a global synthesis is needed to provide the latest ecological science and call attention to the conservation needs of temperate and boreal rainforests A concerted effort to internationalize the plight of the world's temperate and boreal rainforests is underway around the globe this book offers an essential and heretofore missing tool for that effort DellaSala and his contributors tell a compelling story of the importance of temperate and boreal rainforests that includes some surprises e.g. South Africa Iran Turkey Japan Russia This volume provides a comprehensive reference from which to build a collective vision of their future
