Understanding and preventing soil erosion Dr Manuel Seeger, 2024-08-20 Reviews current understanding of the mechanisms of soil erosion focussing on water based and wind

based erosion processes Considers the effectiveness of mitigation measures to reduce soil erosion including buffer strips zero tillage and cover crops Addresses recent advances in techniques used to measure predict track and model soil erosion including digital soil mapping and proximal instrumental techniques Watershed Erosion Processes Tongxin

Zhu,Xiangzhou Xu,2021-09-29 This monograph is a fundamental study of watershed erosion and runoff processes It utilizes decades of soil erosion data to take a comprehensive and balanced approach in covering various watershed erosion processes While there are many works on soil erosion and conservation this book fills the gaps in previously published research by focusing more on mass movement gully erosion soil piping tunnel erosion and the spatial interactions of different erosion processes Additionally the book examines erosion processes in extreme rainfall events something typically absent in short term studies but discussed in detail here as the book draws on 60 years of research and observations including 30 years of the author s own investigations of erosion under a wide range of rainfall conditions The book is divided into 3 parts and is intended for soil erosion researchers and practitioners and postgraduate students studying soil erosion and water conservation Part 1 opens with a comprehensive and critical review of existing literature on soil erosion processes discusses this book s place among existing literature and examines the major erosion processes rainwash gully erosion tunnel erosion and mass movements including their controlling factors and mechanisms Part 2 explores the spatial interactions of these different erosion processes to provide a prerequisite for effective design of comprehensive soil erosion control measures in a watershed Part 3 evaluates the relative significance of these erosion processes in sediment production the effectiveness of comprehensive soil and water conservation programs and the applications of watershed modelling in determining the impact of land use changes on soil erosion and other ecological processes **Ecological Aspects of Soil and Land Preservation**

Pasko, Olga Anatolievna,Lebedeva, Nadezhda Anatolievna,2024-07-16 Agricultural lands worldwide are deteriorating becoming acidic and losing essential humus content This impacts global food quality and nutrition Causes include extreme natural events and harmful human activities like deforestation The consequences are stark shrinking agricultural land reduced fertility lower crop yields and increased costs Developing nations face food shortages population decline and shortened life expectancy The urgency demands international cooperation legislation and technological advancements Ecological Aspects of Soil and Land Preservation delves into this critical issue emphasizing the need for collective action and sustainable solutions Ecological Aspects of Soil and Land Preservation serves as a resource for scholars students and professionals committed to addressing the crisis This book collects summarizes and analyzes the latest information on agricultural land and forest degradation Beyond that it introduces groundbreaking hypotheses theories and solutions enriching the scientific community s understanding The objective is clear to be an informative resource that not only sheds light on the problem but also catalyzes actionable solutions *Impacts of Biomass Harvesting on Soil Disturbance and Surface Soil Erosion at Sellar Creek in Interior British Columbia* P. R. Commandeur,Mark E. Walmsley,Pacific Forestry

Centre, 1993 Numerous studies have documented the soil disturbance effects of ground based harvesting systems Biomass harvesting in the form of the additional recovery of woody materials normally left on site has the potential for increasing the levels of soil disturbance The objective of this study was to document the impact of biomass harvesting by rubber tired skidders on soils namely soil disturbance and surface soil erosion An increase in soil disturbance in the form of skid trails skidroads and deep and very deep gouges was observed on the biomass harvested plots compared to the conventionally harvested plots Erosion bridges indicated more soil movement on the biomass than the conventional plots Soil erosion volumes trapped behind sediment dams located at the base of the plots were greater on the biomass plots average of 0.38 m<sup>3</sup> over 1.77 years than on the conventional plots average of 0.22 m<sup>3</sup> However the unharvested plots also recorded accumulation of material where in fact no mineral soil erosion occurred average of 0.15 m<sup>3</sup> This was the result of vegetation growth and decay and the accumulation of organic matter Adjusted average erosion values of 0.78 m<sup>3</sup> ha year for the biomass plots and 0.37 m<sup>3</sup> ha year for the conventional plots are comparable to data obtained from studies conducted on clearcut and burned sites in the Oregon Cascades These erosion figures are considered moderate and numerous site factors help explain this observed response Rainfall simulation experiments conducted at the site indicated that infiltration rates on skidroads and fireguards are generally greater than 1.5 cm hour Rainfall intensities 15 minute duration that exceed 1.5 cm hour are expected to occur with a return period of about 1 year at the study site Spring snow melt rates may exceed infiltration capacities especially along compacted low infiltration areas such as skidroads Some overland flow and surface soil erosion is expected to occur elsewhere under similar conditions as those found at the study site Recommendations are given regarding the measurement techniques used in this study
