Light Scattering Reviews 5 Alexander A. Kokhanovsky,2010-08-05 Light scattering by densely packed inhomogeneous media is a particularly ch lenging optics problem In most cases only approximate methods are used for the calculations However in the case where only a small number of macroscopic sc tering particles are in contact clusters or aggregates it is possible to obtain exact results solving Maxwell s equations Simulations are possible however only for a relativelysmallnumberofparticles especiallyiftheirsizesarelargerthanthewa length of incident light The rst review chapter in PartI of this volume prepared by Yasuhiko Okada presents modern numerical techniques used for the simulation of optical characteristics of densely packed groups of spherical particles In this case Mie theory cannot provide accurate results because particles are located in the near eld of each other and strongly interact As a matter of fact Maxwell s equations must be solved not for each particle separately but for the ensemble as a whole in this case The author describes techniques for the generation of shapes of aggregates The orientation averaging is performed by a numerical integration with respect to Euler angles The numerical aspects of various techniques such as the T matrix method discrete dipole approximation the nite di erence time domain method e ective medium theory and generalized multi particle Mie so tion are presented Recent advances in numerical techniques such as the grouping and adding method and also numerical orientation averaging using a Monte Carlo method are discussed in great depth **Encyclopedia of Optical Engineering: Las-Pho, pages 1025-2048** Ronald G.
