

Course Outline

ES-301 Environmental Toxicology

Introduction to Toxicology

- Classification and Properties of toxic substances
- Anthropogenic and natural poisons
- Acute and Chronic effects
- Genotoxic, mutagens, teratogens
- Carcinogenic and sensitizers
- **Biological Properties of organic and inorganic pollutants:**
- Essentiality and toxicity
- Route of absorption
- Bioaccumulation and Biomagnification (Lecture + Review Article)

Quantification of Toxicology

- Dose response relationships
- Synergism, Antagonism
- LD50 and rating systems
- Threshold limiting values
- Toxic impacts of atmospheric agents
- Fate of absorbed toxins xenobiotics
- Detoxification and Bioactivation
- Natural detoxification processes
- Risk management

Management Of Risk From Genotoxic Substances In The Environment:

Proceedings--management of Risk from Genotoxic Substances in the Environment Statens strålskyddsinstitut (Sweden),Kemikalieinspektionen (Sweden),Sweden. Statens naturvårdsverk,Symposium and workshop on management of risk from genotoxicsubstances in the environment,1989 *Principles for Decisions Involving Environmental and Health Risks* Gunnar Bengtsson,1989 NKA *Environmental Health Perspectives* ,2003-02 The Law of Environmental Damage Marie-Louise Larsson,2023-09-20 From its starting point within international law throughout its progression from regional to national law The Law of Environmental Damage combines the disciplines of environmental law liability law and insurance in its analysis of the development of reparative environmental law In the model adopted three generations of reparative schemes are identified based on civil liability or administrative liability or self taken measures from the area of insurance The analysis applied is based on factors of standard and designation of liability as well as the definition and assessment of environmental damage Issues such as environmental lender liability and damage to public natural resources are highlighted The results of the study are evaluated within the framework of a theory of environmental efficiency among other factors the reparative effect of liability rules is discussed *Communicating about Risks to Environment and Health in Europe* Philip C.R. Gray,Richard M. Stern,Marco Biocca,2013-04-18 Public experience with risk communication differs greatly from country to country in Europe and there has been little opportunity for the transfer of experience and learning between countries This is especially true for the many new European States including the countries in transition from centralised to market economies This book presents case studies on risk communication One of its unifying concepts is the role of risk communication in the risk management process Technical and philosophical introductions to risk communication and risk management and research in risk communication are given The case studies themselves occupy the central portion of the book each one covering a particular hazard risk or situation seen from a particular point of view The issue of the special circumstances for environmental and health risk communication in central and eastern Europe is also addressed through a separate presentation and discussion of an appropriate case study A different approach to risk communication is taken by examining how it forms part of the risk management process at the local level Research into risk perception a field that forms an important foundation for many aspects of risk communication is summarised and practical guidelines for risk communication are reviewed These include discussions on how to carry out public information programmes and methods for increasing public involvement in risk management decisions Use of Biomarkers in Assessing Health and Environmental Impacts of Chemical Pollutants Curtis C. Travis,2013-11-11 Biological markers biomarkers are useful tools for understanding the nature and extent of human exposure and risk from environmental toxicants Biomarkers are classified into three basic categories exposure effect or susceptibility A marker of exposure is the product of the interaction between a target cell or molecule and a foreign substance NAS 1989 These markers can be used to determine the biologically effective dose

necessary to elicit a particular physiological change in an organism A marker of effect is a biochemical or physiological change in an organism that can predict the onset of adverse health effects resulting from a given exposure Lastly markers of susceptibility act as indicators of an inherent or acquired tendency of an organism to experience an adverse health effect NAS 1989 These markers are already used to detect a variety of diseases and show great promise for developing a better understanding of the mechanisms of disease Additionally biomarkers can be used to establish a more rational basis for quantitative risk extrapolation between species as well as to obtain more precise estimates of the time of critical exposure These markers can also prove helpful in identifying potentially damaging exposures before the onset of adverse health effects Biomarkers serve as a valuable exposure assessment tool because they take into account exposure from all routes and integrate exposure from all sources They have the potential to yield better risk estimates than current monitoring and modeling protocols In June 1992 Dr Travis and Dr
