Natural Products Chemistry Koji Nakanishi, Kōji Nakanishi, 1974      *Dynamic Aspects Of Natural Products Chemistry* Takeshi Ogura, 1997-11-21

Preface Natural products chemistry has a long history and could be regarded as having its roots in the use of many kinds of herbal mixtures as crude drugs in traditional medicine. Systems of traditional medicine have been practiced in China and Japan for thousands of years and virtually all regions of the world have used natural materials to treat human disease. It was clear that many plants, herbs, etc. contain components with powerful biological activities. The dawn of modern natural products chemistry began with the isolation of the active component morphine from opium. Subsequently, various alkaloids were isolated from medicinal plants and employed clinically. The discovery and the development of penicillin as a microbial metabolite opened up the era of antibiotics, which have saved countless lives in the past half century or so. The isolation and synthesis of steroid hormones resulted in the development of new concepts in molecular stereochemistry and organic synthetic techniques, as did the discovery of bioactive lipids such as prostaglandins and leukotrienes, bioactive peptides such as enkephalins and endorphins, and oligosaccharides including glycoproteins. Further, the discovery of plant hormones has led to great strides in plant biotechnology, including plant tissue cultures and derivatives of insect hormones and pheromones, are now used as pesticides. Thus, applications of natural products chemistry have become all pervasive in modern society. Apart from the extensive practical applications of natural products and their derivatives, natural products chemistry has played a central role in the development of modern organic chemistry as a result of its focus on structural and synthetic studies of often highly complex and inaccessible molecules. Biosynthetic studies have also attracted much attention, aiming to answer the questions of why and how such a large number and variety of compounds are synthesised by organisms. Researchers in the field of biosynthesis first focused on elucidation of the pathways of secondary metabolism and then on the mechanisms of the enzymes catalyzing the biosynthetic reactions. This was an extremely difficult task because rather large amounts of enzymes are required for the investigation of reaction mechanisms and the enzyme proteins are often unstable and not easy to purify. However, in recent years, the development of molecular biology has made gene and protein engineering rather routine. Thus, studies of mechanistic enzymology can now be conducted with cloned and overexpressed enzyme proteins. It has been shown that the enzymes responsible for the biosynthesis of antibiotics in *Streptomyces* spp. are encoded in gene clusters. Further cloning and functional analysis of the genes associated with flavonoid biosynthesis should soon cast light on the interesting question of why flavonoids are ubiquitously present in plant leaves. Life is maintained not only by large molecules such as proteins and nucleic acids but also by many small molecules which have essential and diverse roles in the physiology of living organisms. Such compounds often have highly specific interactions with target receptors, but the mechanisms involved largely remain to be explored. Current methodology means that this task can be addressed and this in turn should lead to a host of new applications for natural products and their derivatives. The key may be an interdisciplinary

approach taking account of both biological function and molecular behaviour based on precise structure recognition As we increasingly understand the mechanisms of molecular recognition that operate in nature many possibilities should open up for artificial control or modification of biological functions as well as new challenges for synthetic organic chemists Our intention in this book is to focus on such dynamic aspects of natural products chemistry By dealing in detail with representative topics to which the most modern techniques of research have been applied we hope to emphasize the value of combining traditional approaches to natural products chemists with current biochemical and molecular biological ideas Each chapter provides sufficient background information and experimental detail to make the subject accessible to non specialists It is our hope that these examples of recent progress in key areas of natural products chemistry will stimulate work in related topics by illustrating the power of a modern interdisciplinary approach to the subject

**Monographic Series** Library of Congress, **New Natural Products and Plant Drugs with Pharmacological, Biological or Therapeutical Activity** H.K. Wagner, P.M. Wolff, 2012-12-06 The fact that of the approximately 600 000 plant species existing on the earth only some 5 % have been specifically investigated chemically or pharmacologically is a challenge to chemists specializing in natural substances and to pharmacologists In view of the limited number of research capacities and the ever diminishing financial means this challenge can only be met if together with an improvement and refinement of methods of analysis medicinal plant research is carried out on a broader interdisciplinary basis with comparable scientifically recognized screening methods and if it is better coordinated with greater use of modern documentation means It is thus necessary in the future to concentrate specifically on projects leading to the development of new medicinal preparations The plenary lectures held in the present symposium of the 1st International Congress for Research on Medicinal Plants reflect these efforts and tendencies At the same time they provide a survey of some of the fields of medicinal plant research which are at present most actual and most intensively researched They range from plant screening isolation and structure elucidation of new principles to the therapeutical optimization of a natural product The lectures given at this congress show clearly the necessity in addition to national phytochemical societies for a central international organisation in which all active medicinal plant researchers in the world are included Their aim should be to provide the impulse for more optimal rational research aimed at the solution of specific projects
