

in the lowest part of the Wenlock group, these forms being essentially characteristic of the Lower Silurian rocks. *Cornulites serpularius*, Pl. XVI. f. 6, and other *Annulides* are sometimes found, as well as stems and portions of *Encrinites*, though the perfect fossils are very rare in the typical region. With respect to Corals, it may be stated generally that they are the same as those of the Wenlock limestone, but fewer in number,—the Cup-corals *Cyathophyllum*, *Omphyma*, &c., with *Favosites alveolaris*, and *Stenopora fibrosa*, being the most conspicuous. *Graptolithus priodon*, which is a most abundant and characteristic fossil of the Wenlock shale, has been already figured as occurring in the Lower Silurian rocks, Foss. 12. f. 3, and Pl. XII. f. 1, 2.

Wenlock Limestone.—The upper member of the formation is a limestone, usually of lighter grey colours than the lower calcareous band already described under the name of Woolhope or Lower Wenlock. Although it is in every respect identical with the well-known limestone of Dudley, I named the rock after the sharp rectilinear ridge of Wenlock (see Map), because its relations to inferior and superior deposits are there better seen than in any other part of the British Isles, as exhibited in this sketch.

Wenlock Edge.

WENLOCK EDGE, AS SEEN FROM THE HILLS OF OVERLYING LUDLOW ROCK
ON THE S.W. (From Sil. Syst.)

The Valley of Apes Dale, 1, on the extreme left, is in the Wenlock shale. The linear ridge, 2, is the limestone of Wenlock Edge, dipping under the higher ridge, 3, of Ludlow rocks, which also occupy the foreground.

The Wenlock limestone consists of thick-bedded, grey, subcrystalline limestone, very rarely of light-pink colour, and in parts argillaceous. In other parts of the Wenlock Edge, the rock is more crystalline; and where varied colours prevail, the matrix being charged with *Encrinites* and Corals, it forms a pretty marble, though the slabs are of no great dimensions. The mass is essentially of a concretionary nature, and thus differs much from the flat-bedded Lower Wenlock or Woolhope limestone, being for the most part marked by nodules of small size. Occasionally, however, the concretions are large, and are then locally termed 'ballstones.'

This limestone is underlain and overlain by shale of pale-grey and greenish tints, copiously charged with small nodules of argillaceous lime-

Paleontology And Stratigraphy Of The Silurian Rocks Of The Port:

Paleontology and Stratigraphy of the Silurian Rocks of the Port Daniel-Black Cape Region, Gaspé Stuart Alvord Northrop,1939 **Geology of the Appalachian—Caledonian Orogen in Canada and Greenland** Harold Williams,1995

This volume focuses on the Canadian Appalachian region The chapter on the East Greenland Caledonides stands alone and there is no attempt to integrate the geological accounts of the two far removed regions Rocks of the Canadian Appalachian region are described under four broad temporal divisions lower Paleozoic and older middle Paleozoic upper Paleozoic and Mesozoic The rocks of these temporal divisions define geographic zones belts basins and graben respectively The area is of special interest because so many modern concepts of mountain building are based on Appalachian rocks structures
