David Cruz-Uribe,Alberto Fiorenza,Michael Ruzhansky,Jens Wirth,2014-07-22 This book targets graduate students and researchers who want to learn about Lebesgue spaces and solutions to hyperbolic equations It is divided into two parts Part 1 provides an introduction to the theory of variable Lebesgue spaces Banach function spaces like the classical Lebesgue spaces but with the constant exponent replaced by an exponent function These spaces arise naturally from the study of partial differential equations and variational integrals with non standard growth conditions They have applications to electrorheological fluids in physics and to image reconstruction After an introduction that sketches history and motivation the authors develop the function space properties of variable Lebesgue spaces proofs are modeled on the classical theory Subsequently the Hardy Littlewood maximal operator is discussed In the last chapter other operators from harmonic analysis are considered such as convolution operators and singular integrals The text is mostly self contained with only some more technical proofs and background material omitted Part 2 gives an overview of the asymptotic properties of solutions to hyperbolic equations and systems with time dependent coefficients First an overview of known results is given for general scalar hyperbolic equations of higher order with constant coefficients Then strongly hyperbolic systems with time dependent coefficients are considered A feature of the described approach is that oscillations in coefficients are allowed Propagators for the Cauchy problems are constructed as oscillatory integrals by working in appropriate time frequency symbol classes A number of examples is considered and the sharpness of results is discussed An exemplary treatment of dissipative terms shows how effective lower order terms can change asymptotic properties and thus complements the exposition **Weight**

Theory for Integral Transforms on Spaces of Homogeneous Type Ioseb Genebashvili,Amiran Gogatishvili,Vakhtang Kokilashvili,Miroslav Krbec,1997-05-15 This volume gives an account of the current state of weight theory for integral operators such as maximal functions Riesz potential singular integrals and their generalization in Lorentz and Orlicz spaces Starting with the crucial concept of a space of homogeneous type it continues with general criteria for the boundedness of the integral operators considered then address special settings and applications to classical operators in Euclidean spaces

generalizations and its applications to one and two weight norm inequalities The book is based upon a new and elementary proof of the classical extrapolation theorem that fully develops the power of the Rubio de Francia iteration algorithm This technique allows us to give a unified presentation of the theory and to give important generalizations to Banach function spaces and to two weight inequalities We provide many applications to the classical operators of harmonic analysis to illustrate our approach giving new and simpler proofs of known results and proving new theorems The book is intended for advanced graduate students and researchers in the area of weighted norm inequalities as well as for mathematicians who want to apply extrapolation to other areas such as partial differential equations

Harmonic Analysis María Cristina Pereyra, Lesley A. Ward, 2012 Conveys the remarkable beauty and applicability of the ideas that have grown from Fourier theory It presents for an advanced undergraduate and beginning graduate student audience the basics of harmonic analysis from Fourier's study of the heat equation and the decomposition of functions into sums of cosines and sines frequency analysis to dyadic harmonic analysis and the decomposition of functions into a Haar basis time localization

Invariant Subspaces of the Shift Operator Javad Mashreghi, Emmanuel Fricain, William Ross, 2015-04-23 This volume contains the proceedings of the CRM Workshop on Invariant Subspaces of the Shift Operator held August 26-30 2013 at the Centre de Recherches Mathématiques Université de Montréal Montréal Québec Canada The main theme of this volume is the invariant subspaces of the shift operator or its adjoint on certain function spaces in particular the Hardy space Dirichlet space and de Branges-Rovnyak spaces These spaces and the action of the shift operator on them have turned out to be a precious tool in various questions in analysis such as function theory Bieberbach conjecture rigid functions Schwarz-Pick inequalities operator theory invariant subspace problem composition operator and systems and control theory Of particular interest is the Dirichlet space which is one of the classical Hilbert spaces of holomorphic functions on the unit disk From many points of view the Dirichlet space is an interesting and challenging example of a function space Though much is known about it several important open problems remain most notably the characterization of its zero sets and of its shift invariant subspaces This book is co-published with the Centre de Recherches Mathématiques

The Hodge-Laplacian Dorina Mitrea, Irina Mitrea, Marius Mitrea, Michael Taylor, 2025-01-27 The core of this monograph is the development of tools to derive well-posedness results in very general geometric settings for elliptic differential operators A new generation of Calderón-Zygmund theory is developed for variable coefficient singular integral operators which turns out to be particularly versatile in dealing with boundary value problems for the Hodge-Laplacian on uniformly rectifiable subdomains of Riemannian manifolds via boundary layer methods In addition to absolute and relative boundary conditions for differential forms this monograph treats the Hodge-Laplacian equipped with classical Dirichlet-Neumann-Transmission-Poincaré and Robin boundary conditions in regular Semmes-Kenig-Toro domains The 1st edition of the Hodge-Laplacian De Gruyter Studies in Mathematics Volume 64

2016 is a trailblazer of its kind having been written at a time when new results in Geometric Measure Theory have just emerged or were still being developed In particular this monograph is heavily reliant on the bibliographical items The latter was at the time an unpublished manuscript which eventually developed into the five volume series Geometric Harmonic Analysis published by Springer 2022 2023 The progress registered on this occasion greatly impacts the contents of the Hodge Laplacian and warrants revisiting this monograph in order to significantly sharpen and expand on previous results This also allows us to provide specific bibliographical references to external work invoked in the new edition Lying at the intersection of partial differential equations harmonic analysis and differential geometry this text is suitable for a wide range of PhD students researchers and professionals

Classical Fourier Analysis Loukas Grafakos, 2014-11-17 The main goal of this text is to present the theoretical foundation of the field of Fourier analysis on Euclidean spaces It covers classical topics such as interpolation Fourier series the Fourier transform maximal functions singular integrals and Littlewood Paley theory The primary readership is intended to be graduate students in mathematics with the prerequisite including satisfactory completion of courses in real and complex variables The coverage of topics and exposition style are designed to leave no gaps in understanding and stimulate further study This third edition includes new Sections 3.5, 4.4, 4.5 as well as a new chapter on Weighted Inequalities which has been moved from GTM 250 2nd Edition Appendices I and B.9 are also new to this edition Countless corrections and improvements have been made to the material from the second edition Additions and improvements include more examples and applications new and more relevant hints for the existing exercises new exercises and improved references
