# Real Time Ultrasonography

**Jean-Noel Bruneton**

## **Real Time Ultrasonography:**

**Ultrasonography of the Neck** Jean-Noel Bruneton, 2012-12-06 Owing to the anatomic complexity of the neck and the diversity of pathologic entities affecting it the cervical region has long been of great semiological interest Physical examination is an easy means of evaluating the size and origin of a solitary cervical mass yet valid interpretation can prove difficult when the normal morphology of the neck has been altered excellent examples are patients with extensive fibrosis or scarring secondary to previous irradiation or surgery Like wise physical examination cannot assess the relations of a pathologic process to adjacent structures e g invasion can not be distinguished from simple displacement and it is unsuitable for monitoring therapeutic efficacy such as the response of metastatic nodes to medical management Between physical examination which remains fundamental and exploratory surgical procedures which are often the only means of obtaining indispensable anatomic proof for diagnosis lie a number of recent imaging techniques including computed tomography and magnetic resonance imaging using surface coils that provide invaluable information for the investigation of cervical pathologies Real time ultrasonography occupies a privileged position because of its noninvasiveness rapidity and reliability especially when performed by a specially trained examiner

**Endobronchial Ultrasound** Armin Ernst, Felix JF Herth, 2009-06-10 Endobronchial ultrasound has received explosive attention amongst pulmonologists thoracic surgeons and gastroenterologists and the procedure is increasingly being performed Even though the technology has been in use for over 10 years technical modifications have just recently lead to the ability for near ubiquitous use The editors and contributors have all been active in the field for years are well published and certainly are considered opinion leaders and well traveled teachers having offered many courses in bronchoscopy and endobronchial ultrasound      **Diagnostic Ultrasound and Animal Reproduction** M.A.M. Taverne, A.H.

Willemsse, 2013-06-29 The use of ultrasonic imaging techniques for diagnostic purposes in veterinary medicine and animal science has lagged far behind their use in human medicine In the area of domestic animal reproduction diagnostic ultrasonography has a relatively short history Reports on B mode scanning first appeared as late as 1969 when Stouffer and co workers used it for counting foetal numbers in late gestation sheep After Lindahl had re evaluated the potential of two

dimensional ultrasonography for pregnancy diagnosis in sheep in 1976 results of the first large scale field trials by Fowler and Wilkins on predicting foetal numbers during the first half of gestation in sheep were published as recently as 1980 In this year also the first paper by Palmer and co workers on ultrasonic scanning of the uterus and ovaries in the mare appeared The improvement of diagnostics which was achieved by the application of this technique is illustrated by its present routine use in clinical equine practice and sheep breeding Besides offering an accurate early pregnancy diagnosis in species such as the horse cow sheep goat pig and dog ultrasonography enables the visualization of ovarian and uterine structures for the identification of both physiological and pathological conditions In this way it replaces or supplements the more common diagnostic techniques used by the general practitioner so far Ultrasonography has also opened several new lines of research for clinicians and research workers

Lazzaroni, S. Gigli, D. Gabina, 2023-08-28 Livestock production systems will only be sustained in the long term if their products continue to meet the demand of consumers The quality of ruminant carcasses meat and meat products is of predominant importance in a competitive market where consumers tend to have a preconceived idea about the criteria that define meat quality such as flavour tenderness juiciness smell colour and texture The carcass evaluation could be interesting as a precocious classification of the final quality of meat coming from each carcass Today the quality characteristics of the meat must be different according to its

utilisation supermarket butcher catering refectory etc and so it is very important to choose very early the final destination of the carcass Obviously the carcass classification must correlate with meat quality characteristics required by final consumer Other important factors that have to be taken into account in order to maintain a demand for ruminant meat are safety and traceability This book reviews the historical and recent developments for carcass evaluation and grading for meat quality assessment in beef and sheep It places special emphasis on new concepts and approaches to define carcass and meat quality and on the use of modern technologies for composition and quality evaluation A range of technologies are presented such as ultrasounds and colour reflectance X ray computerised tomography spectral and thermal imaging image analysis and NIRS The use of phenotypic markers such as the plasma hormones and genetic markers to predict carcass composition and meat quality are also presented
