Man Induced Land Subsidence:

Man-induced Land Subsidence Thomas L. Holzer, 1984 *Man-induced Land Subsidence* Thomas L. Holzer, 1984 Land subsidence has been caused by man's activities in at least 37 of the 50 states of the United States and affects more than 40 000 square kilometres in this country alone Data from a few sites where economic impact is documented suggest a total annual cost to the nation of more than 100 million worldwide the total economic impact is astounding and growing These nine papers constitute a major contribution to measuring and understanding this problem and are arranged in 3 categories fluid withdrawal from porous media drainage of organic soil and collapse into man made and natural cavities **Mitigating Losses from Land Subsidence in the United States** Panel on Land Subsidence, 1991-01-01 *Land Subsidence in the United States* ,2000 *The Science of Land Subsidence* Frank R. Spellman, 2024-07-16 The Science of Land Subsidence explains the current science underpinning natural and human made land subsidence events and provides students and interested readers with sufficient background on the basics of geology natural science chemical and environmental engineering Moreover it presents a wide ranging discussion presented in the author's comprehensible conversational style describing the impact of land subsidence events on health sustenance and society in general and provides various case studies covering catastrophic land subsidence events This book is directed at undergraduate and graduate students professionals scientists and the general reading public who would like to gain a broad multidisciplinary view of one of the greatest challenges of our generation Describes the impact of land subsidence events on health sustenance and society in general Provides various case studies covering catastrophic land subsidence events *Numerical Analysis and Modelling in Geomechanics* John W. Bull, 2003-04-17 In geomechanics existing design methods are very much dependent upon sophisticated on site techniques to assess ground conditions This book describes numerical analysis computer simulation and modelling that can be used to answer some highly complex questions associated with geomechanics The contributors who are all international experts in the *Land Subsidence Analysis in Urban Areas* David G. Zeitoun, Eliyahu Wakshal, 2013-01-05 Cities built on unconsolidated sediments consisting of clays silt peat and sand are particularly susceptible to subsidence Such regions are common in delta areas where rivers empty into the oceans along flood plains adjacent to rivers and in coastal marsh lands Building cities in such areas aggravates the problem for several reasons 1 Construction of buildings and streets adds weight to the region causing additional soil deformations 2 Often the regions have to be drained in order to be occupied This results in lowering of the water table and leads to hydro compaction 3 Often the groundwater is used as a source of water for both human consumption and industrial use 4 Levees and dams are often built to prevent or control flooding Earth fissures caused by ground failure in areas of uneven or differential compaction have damaged buildings roads and highways railroads flood control structures and sewer lines As emphasized by Barends in order to develop a legal framework to claims and litigation it is essential that direct and indirect causes of land subsidence effects can be quantified with sufficient

accuracy from a technical and scientific point of view Most existing methods and software applications treat the subsidence problem by analyzing one of the causes This is due to the fact that the causes appear at different spatial scales For example over pumping creates large scale subsidence while building loading creates local subsidence consolidation only Then maximum permissible land subsidence or consolidation is a constraint in different management problems such as groundwater management planning of town and or laws on building construction It is therefore necessary to quantify the contribution of each cause to soil subsidence of the ground surface in cities urban area In this text book we present an engineering approach based on the Biotsystem of equations to predict the soil settlement due to subsidence resulting from different causes Also we present a case study of The Bangkok Metropolitan Area BMA

Geohazards Caused by Human Activity Arvin Farid,2016-11-30 This book is based on the contributions of several authors and attempts to describe the roles human activities play in causing geohazards either directly or indirectly through man made climate change The risk of these man made geohazards and the risk assessment are also discussed in this book Each chapter keeps the authors notations that vary from chapter to chapter These authors notations have been maintained to reduce unintended confusion and errors Readers should be aware of this variation

Site Characterization in Karst and Pseudokarst Terraines Richard C. Benson,Lynn B. Yuhr,2015-09-24 This book provides a practical strategy for obtaining

a more complete and accurate geologic site characterization The strategy and methods to characterize complex geologic settings are readily available The strategy utilizes readily available technology basic science and good old fashioned common sense resulting in a solid understanding of geologic and even karst or pseudokarst conditions We provide an introduction to many off the shelf methods available for site characterization as well as examples of their application throughout the book The purpose of a geologic site characterization is to understand the 3 dimensional geologic framework along with the engineering and hydrologic properties of a site including any man made impacts A well done site characterization is the cornerstone of all geotechnical groundwater and environmental projects The geologic conditions particularly karst conditions can significantly impact a site including its structural stability groundwater pathways and potential for rapid transport or traps for contaminants Once we have adequately characterized the geologic conditions can we carry our remediation design and construction model flow and make risk assessments that are accurate and reliable

Natural Disasters David Alexander, 2018-10-24 As a well balanced and fully illustrated introductory text this book provides a comprehensive overview of the physical technological and social components of natural disaster The main disaster producing agents are reviewed systematically in terms of geophysical processes and effects monitoring mitigation and warning The relationship between disasters and society is examined with respect to a wide variety of themes including damage assessment and prevention hazard mapping emergency preparedness the provision of shelter and the nature of reconstruction Medical emergencies and the epidemiology of disasters are described and refugee management and aid to the Third World are discussed A chapter is devoted to the sociology psychology economics and history of disasters In many parts of the world the toll of death injury damage and deprivation caused by natural disasters is becoming increasingly serious Major earthquakes volcanic eruptions droughts floods and other similar catastrophes are often followed by large relief operations characterized by substantial involvement of the international community The years 1990 2000 have therefore been designated by the United Nations as the International Decade for Natural Disaster Reduction The book goes beyond mere description and elevates the field of natural catastrophes to a serious academic level The author's insights and perspectives are also informed by his practical experience of being a disaster victim and survivor and hence the unique perspective of a participant observer Only by surmounting the boundaries between disciplines can natural catastrophe be understood and mitigation efforts made effective Thus this book is perhaps the first completely interdisciplinary fully comprehensive survey of natural hazards and disasters It has a clear theoretical basis and it recognizes the importance of six fundamental approaches to the field which it blends carefully in the text in order to avoid the partiality of previous works It covers the earth and social sciences as well as engineering architecture and development studies This breadth is made possible by virtue of a strong emphasis on simple principles of the interaction of geophysical agents with human vulnerability and response All students of environmental sciences studies and geography should find this book useful It is an introductory text which treats this dramatic subject area

as something demanding serious academic treatment and not just as an assemblage of horror stories This book is intended for undergraduate students in geography and environmental studies sciences The book should also appeal to any professional or researcher concerned with man environment relations whether in social science or natural science or engineering
