

SPECIES & ECOSYSTEM SURVIVAL

Every species plays a crucial role in the health and survival of its ecosystem. From food production to oxygen generation, pollination to seed dispersal, pest control, disease reduction, and waste recycling, each plant, animal and fungi is part of an intricate web of interconnected life.

Species roles are illustrated here using miombo woodland as an example – a forest type found across much of southern Africa.

1 Plants absorb carbon dioxide from the air and release oxygen that animals need to survive. Plants store carbon in their leaves, trunks, and roots as well as in the soil around them. This reduces the amount of carbon dioxide entering the atmosphere and therefore helps reduce global warming. Plants help maintain water supplies by storing and releasing moisture, including floods and droughts.

2 Plants use energy from the sun, to convert carbon dioxide and water into glucose. This is the basis of food for almost all species in the world. Herbivores like elephants and antelopes eat plants and they can become food for carnivores like lions and wild dogs.

3 Flowering plants need to be pollinated to reproduce. Different species of insects, birds, and mammals pollinate different plants. For example bats and moths pollinate baobab trees and many miombo species are pollinated by bees.

4 Many plants rely on animals to disperse their seeds, enabling new plants to grow. For example elephants, primates and birds eat fruit that disperses the seeds, fertilised by their dung, far from the parent plant.

5 Nature recycles everything, with many different species contributing to nutrient transfer. For example, dung beetles collect and bury faeces, cycling nutrients back into the soil. Millipedes feed on dead and decaying organic matter and transfer nutrients through their droppings.

6 Every species – including humans – contributes to ecosystem balance. Disrupting this balance can cause more negative consequences. For example, if natural habitat is reduced by humans, invasive animals like baboons and elephants may threaten existing people's farms, leading to community tensions. Disrupting habitat also increases the risk of disease transfer to humans.

7 There is a constant cycle of life and death, with many species helping dispose of dead matter, keeping the environment clean and healthy. For example vultures dispose of carcasses, helping prevent the spread of diseases like anthrax and rabies.

8 A healthy ecosystem has a balance of predators that keep pest populations under control. For example crocodiles eat as hippos and giraffes eat reeds, keeping their populations low. Many predators and omnivores reduce the number of sap-sucking insects such as mosquitoes and flies.

Nature And Science Of Survival:

Science, God and the Nature of Reality Sarah S. Knox, 2010 This philosophy of science book is written by a biomedical scientist for a lay audience but is well referenced for use by scientific readers and college course curricula Its thesis is that the current paradigm in the biological and medical sciences which is responsible for rejecting the existence of a Divine Being is outdated There is no factual basis for creating a dichotomy between evolution and Divine Design Misconceptions about the nature of reality i e the belief that matter is the ultimate cause of everything we think feel say and do have made it easy to ignore data demonstrating an important biological role for the energetic aspects of matter and to leave the question of the existence of a Divine being to the purview of philosophy and religion The author uses extensive scientific data to highlight the inconsistencies in current theories and relates her personal journey in trying to explain her observations with purely mechanistic theories Her ultimate conclusion is that the existence or non existence of God can no longer be ignored by scientists It is one of the most important scientific questions there is and like many other issues that were formally relegated to the domain of philosophy can and should be investigated by modern science

volumes of this edition illustrate that developmental science is in the midst of a very exciting period There is a paradigm shift that involves increasingly greater understanding of how to describe explain and optimize the course of human life for diverse individuals living within diverse contexts This Handbook is the definitive reference for educators policy makers researchers students and practitioners in human development psychology sociology anthropology and neuroscience *Bulletin of the Atomic Scientists* ,1971-05 The Bulletin of the Atomic Scientists is the premier public resource on scientific and technological developments that impact global security Founded by Manhattan Project Scientists the Bulletin s iconic Doomsday Clock stimulates solutions for a safer world Until Darwin, Science, Human Variety and the Origins of Race B Ricardo
