Varieties William Fulton, 1993 Toric varieties are algebraic varieties arising from elementary geometric and combinatorial objects such as convex polytopes in Euclidean space with vertices on lattice points Since many algebraic geometry notions such as singularities birational maps cycles homology intersection theory and Riemann Roch translate into simple facts about polytopes toric varieties provide a marvelous source of examples in algebraic geometry In the other direction general facts from algebraic geometry have implications for such polytopes such as to the problem of the number of lattice points they contain In spite of the fact that toric varieties are very special in the spectrum of all algebraic varieties they provide a remarkably useful testing ground for general theories The aim of this mini course is to develop the foundations of the study of toric varieties with examples and describe some of these relations and applications The text concludes with Stanley's theorem characterizing the numbers of simplices in each dimension in a convex simplicial polytope Although some general theorems are quoted without proof the concrete interpretations via simplicial geometry should make the text accessible to beginners in algebraic geometry **Machine Learning and Knowledge Discovery in Databases** Massih-Reza

Amini, Stéphane Canu, Asja Fischer, Tias Guns, Petra Kralj Novak, Grigorios Tsoumakas, 2023-03-16 The multi volume set LNAI 13713 until 13718 constitutes the refereed proceedings of the European Conference on Machine Learning and Knowledge Discovery in Databases ECML PKDD 2022 which took place in Grenoble France in September 2022 The 236 full papers presented in these proceedings were carefully reviewed and selected from a total of 1060 submissions In addition the proceedings include 17 Demo Track contributions The volumes are organized in topical sections as follows Part I Clustering and dimensionality reduction anomaly detection interpretability and explainability ranking and recommender systems transfer and multitask learning Part II Networks and graphs knowledge graphs social network analysis graph neural networks natural language processing and text mining conversational systems Part III Deep learning robust and adversarial machine learning generative models computer vision meta learning neural architecture search Part IV Reinforcement

Katz, 1988 The study of exponential sums over finite fields begun by Gauss nearly two centuries ago has been completely transformed in recent years by advances in algebraic geometry culminating in Deligne's work on the Weil Conjectures It now appears as a very attractive mixture of algebraic geometry representation theory and the sheaf theoretic incarnations of such standard constructions of classical analysis as convolution and Fourier transform The book is simultaneously an account of some of these ideas techniques and results and an account of their application to concrete equidistribution questions concerning Kloosterman sums and Gauss sums

Renormalization and 3-manifolds which Fiber Over the Circle Curtis T. McMullen, 1996-07-28 Many parallels between complex dynamics and hyperbolic geometry have emerged in the past decade Building on work of Sullivan and Thurston this book gives a unified treatment of the construction of fixed points for renormalization and the construction of hyperbolic 3 manifolds fibering over the circle Both subjects are studied via geometric limits and rigidity This approach shows open hyperbolic manifolds are inflexible and yields quantitative counterparts to Mostow rigidity In complex dynamics it motivates the construction of towers of quadratic like maps and leads to a quantitative proof of convergence of renormalization Global Surgery Formula for the Casson-Walker Invariant Christine Lescop, 1996-01-11 This book presents a new result in 3 dimensional topology It is well known that any closed oriented 3 manifold can be obtained by surgery on a framed link in S^3 In Global Surgery Formula for the Casson Walker Invariant a function F of framed links in S^3 is described and it is proven that F consistently defines an invariant λ of closed oriented 3 manifolds λ is then expressed in terms of previously known invariants of 3 manifolds For integral homology spheres λ is the invariant introduced by Casson in 1985 which allowed him to solve old and famous questions in 3 dimensional topology λ becomes simpler as the first Betti number increases As an explicit function of Alexander polynomials and surgery coefficients of framed links the function F extends in a natural way to framed links in rational homology spheres It is proven that F describes the variation of λ under any surgery starting from a rational homology sphere Thus F yields a global surgery formula for the Casson invariant **The Action**

Principle and Partial Differential Equations Demetrios Christodoulou, 2000-01-17 This book introduces new methods in the theory of partial differential equations derivable from a Lagrangian These methods constitute in part an extension to partial differential equations of the methods of symplectic geometry and Hamilton Jacobi theory for Lagrangian systems of ordinary differential equations A distinguishing characteristic of this approach is that one considers at once entire families of solutions of the Euler Lagrange equations rather than restricting attention to single solutions at a time The second part of the book develops a general theory of integral identities the theory of compatible currents which extends the work of E Noether

Finally the third part introduces a new general definition of hyperbolicity based on a quadratic form associated with the Lagrangian which overcomes the obstacles arising from singularities of the characteristic variety that were encountered in previous approaches On the basis of the new definition the domain of dependence theorem and stability properties of solutions are derived Applications to continuum mechanics are discussed throughout the book The last chapter is devoted to the electrodynamics of nonlinear continuous media

Period Spaces for p -divisible Groups M. Rapoport, Thomas Zink, 1996 In this monograph p adic period domains are associated to arbitrary reductive groups Using the concept of rigid analytic period maps the relation of p adic period domains to moduli space of p divisible groups is investigated In addition non archimedean uniformization theorems for general Shimura varieties are established The exposition includes background material on Grothendieck's mysterious functor Fontaine theory on moduli problems of p divisible groups on rigid analytic spaces and on the theory of Shimura varieties as well as an exposition of some aspects of Drinfeld's original construction In addition the material is illustrated throughout the book with numerous examples

Surveys on Surgery Theory Sylvain E. Cappell, Charles Terence Clegg Wall, Andrew Ranicki, Jonathan Rosenberg, 2000-01-10 Surgery theory the basis for the classification theory of manifolds is now about forty years old There have been some extraordinary accomplishments in that time which have led to enormously varied interactions with algebra analysis and geometry Workers in many of these areas have often lamented the lack of a single source that surveys surgery theory and its applications Indeed no one person could write such a survey The sixtieth birthday of C T C Wall one of the leaders of the founding generation of surgery theory provided an opportunity to rectify the situation and produce a comprehensive book on the subject Experts have written state of the art reports that will be of broad interest to all those interested in topology not only graduate students and mathematicians but mathematical physicists as well Contributors include J Milnor S Novikov W Browder T Lance E Brown M Kreck J Klein M Davis J Davis I Hambleton L Taylor C Stark E Pedersen W Mio J Levine K Orr J Roe J Milgram and C Thomas

Radically Elementary Probability Theory Edward Nelson, 1987 Using only the very elementary framework of finite probability spaces this book treats a number of topics in the modern theory of stochastic processes This is made possible by using a small amount of Abraham Robinson's nonstandard analysis and not attempting to convert the results into conventional form

Surveys on Surgery Theory, Volume 2 Sylvain Cappell, Andrew Ranicki, Jonathan Rosenberg, 2014-09-08 Surgery theory the basis for the classification theory of manifolds is now about forty years old The sixtieth birthday on December 14 1996 of C T C Wall a leading member of the subject's founding generation led the editors of this volume to reflect on the extraordinary accomplishments of surgery theory as well as its current enormously varied interactions with algebra analysis and geometry Workers in many of these areas have often lamented the lack of a single source surveying surgery theory and its applications Because no one person could write such a survey the editors asked a variety of experts to report on the areas of current interest This is the second of two volumes resulting from that collective effort It will be useful

to topologists to other interested researchers and to advanced students The topics covered include current applications of surgery Wall's finiteness obstruction algebraic surgery automorphisms and embeddings of manifolds surgery theoretic methods for the study of group actions and stratified spaces metrics of positive scalar curvature and surgery in dimension four In addition to the editors the contributors are S Ferry M Weiss B Williams T Goodwillie J Klein S Weinberger B Hughes S Stolz R Kirby L Taylor and F Quinn

Rigid Local Systems Nicholas M. Katz, 1996 Riemann introduced the concept of a local system on P^1 a finite set of points nearly 140 years ago His idea was to study n th order linear differential equations by studying the rank n local systems of local holomorphic solutions to which they gave rise His first application was to study the classical Gauss hypergeometric function which he did by studying rank two local systems on $P^1 \setminus \{0, 1, \infty\}$ His investigation was successful largely because any such irreducible local system is rigid in the sense that it is globally determined as soon as one knows separately each of its local monodromies It became clear that luck played a role in Riemann's success most local systems are not rigid Yet many classical functions are solutions of differential equations whose local systems are rigid including both of the standard n th order generalizations of the hypergeometric function ${}_nF_{n-1}$ s and the Pochhammer hypergeometric functions This book is devoted to constructing all irreducible rigid local systems on P^1 a finite set of points and recognizing which collections of independently given local monodromies arise as the local monodromies of irreducible rigid local systems Although the problems addressed here go back to Riemann and seem to be problems in complex analysis their solutions depend essentially on a great deal of very recent arithmetic algebraic geometry including Grothendieck's étale cohomology theory Deligne's proof of his far reaching generalization of the original Weil Conjectures the theory of perverse sheaves and Laumon's work on the l -adic Fourier Transform

The Real Fatou Conjecture Jacek Graczyk, Grzegorz Świątek, 1998-10-25 In 1920 Perre Fatou expressed the conjecture that except for special cases all critical points of a rational map of the Riemann sphere tend to periodic orbits under iteration This book provides a rigorous proof of the Real Fatou Conjecture that in spite of the apparently elementary nature of a problem its solution requires advanced tools of complex analysis

Euler Systems Karl Rubin, 2000-05-21 One of the most exciting new subjects in Algebraic Number Theory and Arithmetic Algebraic Geometry is the theory of Euler systems Euler systems are special collections of cohomology classes attached to p -adic Galois representations Introduced by Victor Kolyvagin in the late 1980s in order to bound Selmer groups attached to p -adic representations Euler systems have since been used to solve several key problems These include certain cases of the Birch and Swinnerton Dyer Conjecture and the Main Conjecture of Iwasawa Theory Because Selmer groups play a central role in Arithmetic Algebraic Geometry Euler systems should be a powerful tool in the future development of the field Here in the first book to appear on the subject Karl Rubin presents a self contained development of the theory of Euler systems Rubin first reviews and develops the necessary facts from Galois cohomology He then introduces Euler systems states the main theorems and develops examples and applications The remainder of the book is devoted to the proofs of the

main theorems as well as some further speculations The book assumes a solid background in algebraic Number Theory and is suitable as an advanced graduate text As a research monograph it will also prove useful to number theorists and researchers in Arithmetic Algebraic Geometry Characteristic Classes John Willard Milnor, James D. Stasheff, 1974 The theory of characteristic classes provides a meeting ground for the various disciplines of differential topology differential and algebraic geometry cohomology and fiber bundle theory As such it is a fundamental and an essential tool in the study of differentiable manifolds In this volume the authors provide a thorough introduction to characteristic classes with detailed studies of Stiefel Whitney classes Chern classes Pontrjagin classes and the Euler class Three appendices cover the basics of cohomology theory and the differential forms approach to characteristic classes and provide an account of Bernoulli numbers Based on lecture notes of John Milnor which first appeared at Princeton University in 1957 and have been widely studied by graduate students of topology ever since this published version has been completely revised and corrected **Theory of Formal**

Systems Raymond M. Smullyan, 1961 This book serves both as a completely self contained introduction and as an exposition of new results in the field of recursive function theory and its application to formal systems **Ends of Complexes** Bruce

Hughes, Andrew Ranicki, 1996-08-28 A systematic exposition of the theory and practice of ends of manifolds and CW complexes not previously available High-dimensional Knot Theory Andrew Ranicki, 2013-04-17 High dimensional knot theory is the study of the embeddings of n dimensional manifolds in $n+2$ dimensional manifolds generalizing the traditional study of knots in the case $n=1$ The main theme is the application of the author's algebraic theory of surgery to provide a unified treatment of the invariants of codimension 2 embeddings generalizing the Alexander polynomials and Seifert forms of classical knot theory Many results in the research literature are thus brought into a single framework and new results are obtained The treatment is particularly effective in dealing with open books which are manifolds with codimension 2 submanifolds such that the complement fibres over a circle The book concludes with an appendix by E Winkelnkemper on the history of open books **Triangulated Categories** Amnon Neeman, 2001-01-23 The first two chapters of this book offer a

modern self contained exposition of the elementary theory of triangulated categories and their quotients The simple elegant presentation of these known results makes these chapters eminently suitable as a text for graduate students The remainder of the book is devoted to new research providing among other material some remarkable improvements on Brown's classical representability theorem In addition the author introduces a class of triangulated categories the well generated triangulated categories and studies their properties This exercise is particularly worthwhile in that many examples of triangulated categories are well generated and the book proves several powerful theorems for this broad class These chapters will interest researchers in the fields of algebra algebraic geometry homotopy theory and mathematical physics *Morse Theory* John Willard Milnor, 1963 One of the most cited books in mathematics John Milnor's exposition of Morse theory has been the most important book on the subject for more than forty years Morse theory was developed in the 1920s by mathematician

Marston Morse Morse was on the faculty of the Institute for Advanced Study and Princeton published his Topological Methods in the Theory of Functions of a Complex Variable in the Annals of Mathematics Studies series in 1947 One classical application of Morse theory includes the attempt to understand with only limited information the large scale structure of an object This kind of problem occurs in mathematical physics dynamic systems and mechanical engineering Morse theory has received much attention in the last two decades as a result of a famous paper in which theoretical physicist Edward Witten relates Morse theory to quantum field theory Milnor was awarded the Fields Medal the mathematical equivalent of a Nobel Prize in 1962 for his work in differential topology He has since received the National Medal of Science 1967 and the Steele Prize from the American Mathematical Society twice 1982 and 2004 in recognition of his explanations of mathematical concepts across a wide range of scientific disciplines The citation reads The phrase sublime elegance is rarely associated with mathematical exposition but it applies to all of Milnor's writings Reading his books one is struck with the ease with which the subject is unfolding and it only becomes apparent after reflection that this ease is the mark of a master Milnor has published five books with Princeton University Press
