Protein Phosphorylation In Cell Growth Regulation:

Protein Phosphorylation in Cell Growth Regulation April Clemens, 1996-12-01 Presents a survey of protein phosphorylation roles in the control of cellular proliferation and differentiation A large number of protein kinases and phosphatases have been characterised in higher cells and have been shown to be involved in signal transduction pathways by which growth factors mitogens and extracellular agents exert proliferative effects on cells Important subjects covered include control of gene expression at the transcriptional and translational levels and roles of the elk kinases and cyclings in cell cycles regulation Describes all major families of protein kinases of significance to growth regulation The aim of this text is to integrate the processes of protein phosphorylation and dephosphorylation into the complex pathways by which cellular proliferation is driven bringing together the many different systems of control implicated in the regulation of cell growth

Farnham, 2012-12-06 It is of critical importance to maintain an appropriate balance between proliferation and quiescence or differentiation through out the lifespan of all animals An important control point in this balance occurs in the G phase of the cell cycle On the basis of environmental cues a cell in G must decide whether to continue through the proliferative cycle and enter S phase where DNA replication occurs or to exit from the proliferative cycle into a

nonreplicating state Alterations in the mechanisms that normally control this decision can lead to cancer cell death or loss of differentiated cellular phenotypes The identification of the E2F gene family of transcription factors has allowed a more complete understanding of how the cell maintains an appropriate proliferative state This volume provides an up to date account of present reports concerning E2F as well as a framework for future investigations E2F activity requires heterodimerization of two partners Either partner can be one of several different transcription factors E2F1 E2F2 E2F3 E2F4 or E2F5 can heterodimerize with either Dp1 or Dp2 Cellular promoters whose E2F sites mediate a link between transcription and proliferation drive genes whose products are required for DNA synthesis and genes that encode regulators of cell growth A detailed analysis of the role that E2F family members play in transcription from these promoters is presented in the chapter by J E SLANSKY and P J FARNHAM

A Molecular and Cellular View of Protein Kinase CK2 Khalil Ahmed, E. Chambaz, Olaf-Georg Issinger, 2012-09-18 It is now generally recognized that protein kinase signaling is involved in virtually every aspect of cell function including growth and proliferation The field of protein phosphorylation including the enzymes involved in this post translational modification continues to advance at a fascinating pace Since the first international meeting on this topic held in Heidelberg in 1994 several new avenues of CK2 research have emerged despite persistent deficiencies in our understanding of the regulation of its activity Among the significant new directions are studies related to the structure of the enzyme especially its crystal structure as well as an interesting aspect of CK2 function that involves its subunits as binding partners of several other proteins In addition new data have been gathered on the role of CK2 in transcription as well as in certain other cellular functions To address these various aspects of the progress of CK2 a number of key scientists from different parts of the world came together at the second international meeting on A Molecular and Cellular View of Protein Kinase CK2 held at Villard de Lans near Grenoble on September 24-26 1997 The meeting was attended by nearly 50 participants and included 28 presentations which provide a view of the latest progress on protein kinase CK2
