Protein Secretion And Export In Bacteria:

Protein Secretion and Export in Bacteria Henry C. Wu, Phang C. Tai, 2012-02-14 The last decade has witnessed rapid progress in our understanding of the mechanisms of protein export and secretion in both prokaryotic and eukaryotic cells. Studies of protein secretion across the membranes of the rough endoplasmic reticulum have led to the formulation of the now classic signal hypothesis which has stimulated many discussions and new ideas and the identification of the signal recognition particle as an organelle in the initiation of the export process. However, more recent work pertaining to intragenomic information related to targeting specific proteins for either secretion or membrane localization, the energetics of protein secretion, the timing of synthesis versus the initiation of export, structural requirements for the processing of precursor proteins, and the identification of the processing enzymes, signal peptidases, has been the result of a combined biochemical and genetic approach to the study of protein localization in bacteria. While reviews on the biochemistry and genetics of protein secretion have appeared frequently in recent years, this book attempts to summarize the current status and the future perspectives of this rapidly moving field in a single volume. Topics covered in this book include the genetics of protein secretion in *E. coli*, biochemical analysis of protein export in vitro, signal peptidases, excretion of colicins and hemolysin in *E. coli*, protein secretion in *Bacillus*, and protein secretion cloning vectors.

Protein Secretion in Bacteria Maria Sandkvist, Eric Cascales, Peter J. Christie, 2019-09-01 Protein transport into and across membranes is a fundamental process in bacteria that touches upon and unites many areas of microbiology including bacterial cell physiology, adhesion and motility, nutrient scavenging, intrabacterial signaling and social behavior, toxin deployment, interbacterial antagonism and collaboration, host invasion and disruption, and immune evasion. A broad repertoire of mechanisms and macromolecular machines are required to deliver protein substrates across bacterial cell membranes for intended effects. Some machines are common to most if not all bacteria, whereas others are specific to Gram-negative or Gram-positive species or species with unique cell envelope properties such as members of Actinobacteria and Spirochetes. *Protein Secretion in Bacteria*, authored and edited by an international team of experts, draws together the many distinct functions and mechanisms involved in protein translocation in one concise tome. This comprehensive book presents updated information on all aspects of bacterial protein secretion encompassing individual secretory systems Sec, Tat, and T1SS through the newly discovered T9SS. Mechanisms, structures, and functions of bacterial secretion systems, lipoprotein sorting pathways, outer membrane vesicles, and the sortase system. Structures and roles of surface organelles including flagella, pili, and curli. Emerging technologies and translational implications. *Protein Secretion in Bacteria* serves as both an introductory guide for students and postdocs and a ready reference for seasoned researchers whose work touches on protein export and secretion. This volume synthesizes the diversity of mechanisms of bacterial secretion across the microbial world into a digestible resource to stimulate new research, inspire continued identification and characterization of novel systems, and bring about new ways to manipulate these systems.

Regulation of Gene Expression in Enteropathogenic Bacteria, Volume II Dongsheng Zhou, Shihua Wang, Xihui Shen, 2021-01-22 Following the success of this Research Topic <http://journal.frontiersin.org/researchtopic/3298> regulation of gene expression in enteropathogenic bacteria we are happy to launch a second edition of the project Pathogenic bacteria have evolved numerous strategies to survive in and to attack hosts which can be reflected by transcriptional and posttranscriptional changes in specific genes especially including those encoding virulence determinants Regulation of gene expression by regulatory proteins and non coding RNAs enables the pathogens to adapt their metabolic needs and to coordinately express virulence determinants during different stages of infection

Genetics and Molecular Biology of Anaerobic Bacteria Madeleine Sebald, 2012-12-06 The field of bacterial genetics has been restricted for many years to *Escherichia coli* and a few other genera of aerobic or facultatively anaerobic bacteria such as *Pseudomonas* *Bacillus* and *Salmonella* The prevailing view up to recent times has been that anaerobic bacteria are interesting organisms but nothing is known about their genetics To most microbiologists anaerobic bacteria appeared as a sort of distant domain reserved for occasional intrusions by taxonomists and medical microbiologists By the mid 1970s knowledge of the genetics and molecular biology of anaerobes began to emerge and then

developed rapidly but also in This was the result of advances in molecular biology techniques portantly because of improvements in basic techniques for culturing anaerobes and for understanding their biochemistry and other areas of interest Investigations in this field were also stimulated by a renewal of interest in their ecology their role in pathology and in biotransformations and in the search for alternative renewable sources of energy The initial idea for this book came from Thomas D Brock When Dr Brock requested my opinion about two years ago on the feasibility of publishing a book on the genetics of anaerobic bacteria as a part of the Brock Springer Series in Contemporary Bioscience I answered positively but I was apprehen sive about assuming the role of editor However I was soon reassured by the enthusiastic commitment of those I approached to contribute Eventually thanks to the caring cooperation of the contributors the task became relatively easy

Bacterial and Eukaryotic Porins Roland Benz,2006-03-06 This first book dedicated to the topic relates the known physiological functions of porins to their molecular structure and mechanism as documented by various in vitro and in vivo methods including the generation of null mutants in mice For the first time it brings together biophysical evidence with studies performed in a cellular context presenting a unified picture of the fundamental importance of porins for cellular function With 16 contributions by an interdisciplinary team of leading porin researchers this reference is essential reading for every molecular or structural biologist with an interest in this essential protein family Filamentous Bacteriophage in Bio/Nano/Technology, Bacterial Pathogenesis and Ecology Jasna Rakonjac,Bhabatosh Das,Ratmir Derda,2017-02-16

Filamentous phage genus Inovirus infect almost invariably Gram negative bacteria They are distinguished from all other bacteriophage not only by morphology but also by the mode of their assembly a secretion like process that does not kill the host Classic Escherichia colifilamentous phage Ff f1 fd and M13 are used in display technology and bio nano technology whereas filamentous phage in general have been put to use by their bacterial hosts for adaptation to environment pathogenesis biofilm formation horizontal gene transfer and modulating genome stability Many filamentous phage have a symbiotic life style that is often manifested by inability to form plaques preventing their identification by standard phage hunting techniques while the absence or very low sequence conservation between phage infecting different species often complicates their identification through bioinformatics Nevertheless the number of discovered filamentous phage is increasing rapidly along with realization of their significance Temperate filamentous phage whose genomes are integrated into the bacterial chromosome of pathogenic bacteria often modulate virulence of the host The Vibrio cholerae phage CTXf genome encodes cholera toxin whereas many filamentous prophage influence virulence without encoding virulence factors The nature of their effect on the bacterial pathogenicity and overall physiology is the next frontier in understanding intricate relationship between the filamentous phage and their hosts Phage display has been widely used as a combinatorial technology of choice for discovery of therapeutic antibodies and peptide leads that have been applied in the vaccine design diagnostics and drug development or targeting over the past thirty years Virion proteins of filamentous phage are integral

membrane proteins prior to assembly hence they are ideal for display of bacterial surface and secreted proteins The use of this technology at the scale of microbial community has potential to identify host interacting proteins of uncultivable or low represented community members Recent applications of Ff filamentous phage extend into protein evolution synthetic biology and nanotechnology In many applications phage serves as a monodisperse long aspect nano scaffold of well defined shape Chemical or genetic modifications of this scaffold are used to introduce the necessary functionalities such as fluorescent labels ligands that target specific proteins or peptides that promote formation of inorganic or organic nanostructures We anticipate that the future holds development of new strategies for particle assembly site specific multi functional modifications and improvement of existing modification strategies These improvements will render the production of filamentous phage templated materials safe and affordable allowing their applications outside of the laboratory
