Telecommunications and Networking Udo W. Pooch, 2018-05-04 As the dividing line between traditional computing science and telecommunications quickly becomes blurred or disappears in today's rapidly changing environment, there is an increasing need for computer professionals to possess knowledge of telecommunications principles. *Telecommunications and Networking* presents a comprehensive overview of the interaction and relationship between telecommunications and data processing. The book's early chapters cover basic telecommunications vocabulary, common nomenclature, telecommunications fundamentals, as well as the important relationships among coding, error detection and correction, and noise. Later chapters discuss such topics as switching, timing, topological structures, routing algorithms and teleprocessing. Other topics covered in detail include specific concerns inherent to computer communications, such as protocols, error detection and correction, network monitoring and security, and system validation. System designers and programmers can no longer be effective simply by understanding the tradeoffs between hardware and software. *Telecommunications and Networking* provides both computing professionals and students the fundamental computer communications concepts necessary to function in today's computer industry.

Data Communication and Networks - 1 Mr. Rohit Manglik, 2024-03-24 Introduces data communication principles and network fundamentals. Covers protocols, topologies and transmission media foundational for network design and management.

Computer Network Architectures and Protocols Paul Green, 2012-12-06 This is a book about the bricks and mortar out of which are built those edifices that so well characterize late twentieth century industrial society: networks of computers and terminals. Such computer networks are playing an increasing role in our daily lives, somewhat indirectly up to now as the hidden servants of banks, retail credit bureaus, airline reservation offices and so forth, but soon they will become more visible as they enter our offices and homes and directly become part of our work, entertainment and daily living. The study of how computer networks work is a combined study of communication theory and computer science, two disciplines appearing to have very little in common. The modern communication scientist wishing to work in this area finds himself in suddenly

unfamiliar territory It is no longer sufficient for him to think of transmission modulation noise immunity error bounds and other abstractions of a single communication link he is dealing now with a topologically complex interconnection of such links And what is more striking solving the problems of getting the signal from one point to another is just the beginning of the communication process The communication must be in the right form to be routed properly to be handled without congestion and to be understood at the right points in the network The communication scientist suddenly finds himself charged with responsibility for such things as code and format conversions addressing flow control and other abstractions of a new and challenging kind
