

Psicologia dell'handicap e della riabilitazione

Disabilità uditiva

Si considera sordo il minorato sensoriale dell'udito, affetto da sordità congenita o acquisita durante l'età evolutiva che gli abbia compromesso il normale apprendimento del linguaggio parlato, purché la sordità non sia di natura esclusivamente psichica o dipendente da causa di guerra, lavoro o servizio. In genere quando parliamo di sordità, inteso come deficit uditivo, non sono comprese le facoltà intellettive (se non associata ad altri handicap) e quindi le problematiche sono collegate alla difficoltà di comunicazione. Dal 2006 è stata finalmente sostituita la parola "sordomuto" con il termine "sordo": in particolare si usa la dicitura sordo perlinugale per indicare una condizione che, insorgendo prima della padronanza del linguaggio parlato, ne compromette l'acquisizione. Da questo momento in poi viene sostituito il precedente concetto di impedimento nell'acquisizione del linguaggio verbale con quello appunto di "compromissione"; vale a dire che l'apprendimento del linguaggio non deve essere considerato impossibile ma solamente difficoltoso e quindi può realizzarsi grazie ad una corretta protesizzazione e a percorsi abilitativi precoci.

La parola sordo dunque fa più correttamente riferimento al solo deficit uditivo, sottendendo l'idea che chi non sente non ha perduto la facoltà di apprendere una lingua, anche se l'accesso alla parola è ostacolato dalla limitazione sensoriale. Tuttavia questo termine ha il limite di non sottolineare che il deficit uditivo molto raramente è totale e che dalla quantità e qualità dei residui uditivi conseguono quadri deficitari estremamente differenziati. Per questo molti studiosi e operatori del settore preferiscono parlare di audiolesi e di ipoacusici, cioè di persone che pur compromesse nell'accesso al mondo dei suoni, conservano tuttavia anche in quest'ambito potenzialità e risorse.

Molti sono i fattori che determinano la variabilità evidenziabile tra persone con deficit uditivo: la causa della sordità, qualità e grado di perdita uditiva, eventuale presenza di altri danni associati, l'appartenenza a famiglie di sordi o udenti, l'estensione dell'esperienza interpersonale, la qualità e il tipo di educazione, la qualità di utilizzo di apparecchi acustici o impianti cocleari, la capacità della rete sociale di fornire un supporto psicologico, materiale e tecnico ai bambini ipoacusici e alle loro famiglie.

Come in altri casi, una corretta e precoce diagnosi è il primo passo di un approccio efficace al problema nel suo complesso. Prima suddivisione del tipo di sordità riguarda la localizzazione del danno:

- sordità trasmissive (3-4% nei bambini) che interessano le parti dell'apparato uditivo deputate alla trasmissione del suono (orecchio esterno e medio);
- sordità percettive che interessano l'orecchio interno e il nervo acustico;
- sordità miste nelle quali si sommano anomalie nella conduzione e nella percezione del suono.

Un'importante classificazione dei tipi di sordità è anche centrata sul fattore di gravità della perdita uditiva, che può essere definita in base alla quantità e alla qualità del deficit; parametri di riferimento sono l'intensità e l'altezza dei suoni percepiti. Le risposte della persona ipoacusica possono variare molto: il deficit uditivo può interessare una gamma più o meno ampia di frequenze, la perdita può essere uniforme o viceversa colpire maggiormente i suoni acuti. La sordità è tanto più grave quanto più alta è l'intensità necessaria perché i suoni vengano ricevuti e quanto minore è la gamma di frequenze che l'orecchio percepisce.

Livelli di deficit:

- lieve: difficoltà a percepire le voci bisbigliate e alcune consonanti (suoni acuti);
- media: difficoltà nel percepire chiaramente una conversazione, difficoltà nella discriminazione di parole (nessuna necessità di protesi);
- grave: percezione solo di alcuni suoni. Necessità di protesi;
- profondo: la parola non viene riconosciuta. Vengono percepiti solo alcuni suoni gravi e intensi.

Un'ulteriore modalità di classificazione può essere operata a partire dalle cause (sordità ereditarie e acquisite) e dall'epoca di insorgenza del deficit (prenatale, perinatale, postnatale).

Attualmente riveste moltissima importanza la possibilità di effettuare una diagnosi precoce e corretta, in quanto negli ultimi anni gli ausili che permettono anche a bambini con sordità profonda di accedere al mondo dei suoni hanno conosciuto una notevole evoluzione: apparecchi acustici tradizionali e impianto cocleare. Le protesi acustiche di nuova generazione utilizzano amplificatori multicanale che consentono di privilegiare le frequenze del parlato, anche in ambienti rumorosi e di garantire un basso grado di distorsione dell'ascolto.
