## **Polynomials And Polynomial Inequalities:**

**Polynomials and Polynomial Inequalities** Peter Borwein, Tamas Erdelyi, 2012-12-06 Polynomials pervade mathematics virtually every branch of mathematics from algebraic number theory and algebraic geometry to applied analysis and computer science has a corpus of theory arising from polynomials The material explored in this book primarily concerns polynomials as they arise in analysis it focuses on polynomials and rational functions of a single variable The book is self contained and assumes at most a senior undergraduate familiarity with real and complex analysis After an introduction to the geometry of polynomials and a discussion of refinements of the Fundamental Theorem of Algebra the book turns to a consideration of various special polynomials Chebyshev and Descartes systems are then introduced and Müntz systems and rational systems are examined in detail Subsequent chapters discuss denseness questions and the inequalities satisfied by polynomials and rational functions Appendices on algorithms and computational concerns on the interpolation theorem and on orthogonality and irrationality conclude the book

**Topics In Polynomials: Extremal Problems, Inequalities, Zeros** Gradimir V Milovanovic, Themistocles M Rassias, D S Mitrinovic, 1994-06-28 The book contains some of the most important results on the analysis of polynomials and their derivatives Besides the fundamental results which are treated with their proofs the book also provides an account of the most recent developments concerning extremal properties of polynomials and their derivatives in various metrics with an extensive analysis of inequalities for trigonometric sums and algebraic polynomials as well as their zeros The final chapter provides some selected applications of polynomials in approximation theory and computer aided geometric design CAGD One can also find in this book several new research problems and conjectures with sufficient information concerning the results obtained to date towards the investigation of their solution

*Progress in Approximation Theory and Applicable Complex Analysis* Narendra Kumar Govil, Ram Mohapatra, Mohammed A. Qazi, Gerhard Schmeisser, 2017-04-03 Current and historical research methods in approximation theory are presented in this book beginning with the 1800s and following the evolution of approximation theory via the refinement and extension of classical methods and ending with recent techniques and methodologies Graduate students postdocs and researchers in mathematics specifically those working in the theory of functions approximation theory geometric function theory and optimization will find new insights as well as a guide to advanced topics The chapters in this book are grouped into four themes the first polynomials Chapters 1-8 includes inequalities for polynomials and rational functions orthogonal polynomials and location of zeros The second inequalities and extremal problems are discussed in Chapters 9-13 The third approximation of functions involves the approximants being polynomials rational functions and other types of functions and are covered in Chapters 14-19 The last theme quadrature cubature and applications comprises the final three chapters and includes an article coauthored by Rahman This volume serves as a memorial volume to commemorate the distinguished career of Qazi Ibadur Rahman 1934-2013 of the Universit de Montr al Rahman was considered by his peers as one of the prominent experts

in analytic theory of polynomials and entire functions The novelty of his work lies in his profound abilities and skills in applying techniques from other areas of mathematics such as optimization theory and variational principles to obtain final answers to countless open problems

**Number Theory for the Millennium III** Bruce Berndt, M.A. Bennett, N. Boston, H.G. Diamond, A.J. Hildebrand, W. Phillip, 2023-03-17 Building on the tradition of an outstanding series of conferences at the University of Illinois at Urbana Champaign the organizers attracted an international group of scholars to open the new Millennium with a conference that reviewed the current state of number theory research and pointed to future directions in the field The conference was the largest general number theory conference in recent history featuring a total of 159 talks with the plenary lectures given by George Andrews Jean Bourgain Kevin Ford Ron Graham Andrew Granville Roger Heath Brown Christopher Hooley Winnie Li Kumar Murty Mel Nathanson Ken Ono Carl Pomerance Bjorn Poonen Wolfgang Schmidt Chris Skinner K Soundararajan Robert Tijdeman Robert Vaughan and Hugh Williams The Proceedings Volumes of the conference review some of the major number theory achievements of this century and to chart some of the directions in which the subject will be heading during the new century These volumes will serve as a useful reference to researchers in the area and an introduction to topics of current interest in number theory for a general audience in mathematics

*Computational Excursions in Analysis and Number Theory* Peter Borwein, 2012-12-06 This book is designed for a topics course in computational number theory It is based around a number of difficult old problems that live at the interface of analysis and number theory Some of these problems are the following The Integer Chebyshev Problem Find a nonzero polynomial of degree  $n$  with integer coefficients that has smallest possible supremum norm on the unit interval Littlewood's Problem Find a polynomial of degree  $n$  with coefficients in the set  $\{-1, 1\}$  that has smallest possible supremum norm on the unit disk The Prouhet-Tarry-Escott Problem Find a polynomial with integer coefficients that is divisible by  $z^{l+1} - 1$  and has smallest possible  $1$  norm That  $1$  is the sum of the absolute values of the

coefficients is minimal Lehmer's Problem Show that any monic polynomial  $p(x) = x^n + a_{n-1}x^{n-1} + \dots + a_0$  with integer coefficients that is irreducible and that is not a cyclotomic polynomial has Mahler measure at least  $1 + \frac{1}{2n}$  All of the above problems are at least forty years old all are presumably very hard certainly none are completely solved and all lend themselves to extensive computational explorations The techniques for tackling these problems are various and include probabilistic methods combinatorial methods the circle method and Diophantine and analytic techniques Computationally the main tool is the LLL algorithm for finding small vectors in a lattice The book is intended as an introduction to a diverse collection of techniques
