On the Origin and Function of Human NK-like CD8+ T Cells: Charting New Territories Fernando A.

Arosa,2018-01-25 Human CD8 T cells expressing NK receptors and receptors found on innate immune cells and designated as NK like or innate CD8 T cells have been long considered as terminally differentiated lymphocytes responsible for tissue inflammation and destruction However a growing body of knowledge is unveiling that NK like CD8 T cells have many sometimes contrasting functions The limited knowledge of the biology of this type of CD8 T cells and the role they play within peripheral tissues and organs under homeostatic conditions has hampered our understanding of disease and therefore the possible development of disease diagnostic tools and effective immunotherapies In this Research Topic are presented a variety of topics and views some of them overlooked for many years on human NK like CD8 T cells which may open new and novel avenues of research to further our understanding of these polyfunctional T cells

T Cell Subsets ,2004-06-26 This first thematic issue of the Advances in Immunology series highlights the remarkable new insights into the mechanisms that govern development and function of T cell lineages Recent developments in the understanding of the genetic and epigenetic mechanisms that regulate development of the two major T cell lineages will have a fundamental impact on a number of research fields immunology cell biology hematology and stem cell research All of these groups have a vested interest in comprehending issues such as stem cell self renewal progenitor plasticity lineage commitment and cellular identity Immunologists have a special interest in the mechanisms that allow selection of a T cell repertoire whose members integrate genetic information for T cell receptor co receptor and specialized immunologic function since this process lies at the core of adaptive immunity T Cell Subsets is a timely and invaluable review for immunologists cell biologists hematologists and stem cell researchers

Generation and Effector Functions of Regulatory Lymphocytes Gregory R. Bock,Jamie A.

Goode,2004-01-19 Over the last several years immunologists have re discovered the importance of regulatory lymphocytes formerly termed suppressor cells Many recent reports have documented their existence effector functions and potential therapeutic benefits in autoimmunity and transplantation However even though modern techniques have allowed us to get a much more detailed picture of these cells they are still highly controversial Several unresolved issues responsible for this dilemma are discussed in this book it is difficult to grow and clone such cells their phenotypes and effector functions are diverse and can sometimes easily be lost and it is not well understood how they interact with antigen presenting cells This book contains contributions from leading investigators from around the world including lively discussion of the current state of the art in studies of regulatory lymphocytes Topics featured are the physiological control of autoimmunity the role of antigen specific cells in various diseases and disease models and effector mechanisms Therapeutic applications are considered particularly for type 1 diabetes tissue transplantation and the control of viral infection This important and

groundbreaking book should be of interest to all immunologists Related Novartis Foundation symposia 254

Jonathan Soboloff, Dietmar J. Kappes, 2017-03-27 T cells play a vital role mediating adaptive immunity a specific acquired
resistance to an infectious agent produced by the introduction of an antigen There are a variety of T cell types with different
functions They are called T cells because they are derived from the thymus gland This volume discusses how T cells are
regulated through the operation of signaling mechanisms Topics covered include positive and negative selection early events

World Manu Rangachari, Nathalie Arbour, Steven M Kerfoot, Jorge I Alvarez, 2017-10-10 Multiple sclerosis is degenerative
disease of the central nervous system CNS in which myelin destruction and axon loss leads to the accumulation of physical
cognitive and mental deficits MS affects more than a million people worldwide and managing this chronic disease presents a
significant health challenge Multiple lines of evidence indicate that MS is an autoimmune disorder in which immune cells
launch an inflammatory attack targeting myelin antigens Indeed myelin reactive T cells and antibodies have been identified
in MS patients and in animal models namely experimental autoimmune encephalomyelitis or EAE that recapitulate many
features of human disease Animal model studies have demonstrated that T cells are both necessary and sufficient to initiate
and sustain CNS autoimmunity However most MS animal models rely on the role played by CD4 T cells and partially
replicate the multiple aspects of MS pathogenesis Thus research in the past has focused heavily on the contribution of CD4 T
cells to the disease process searching PubMed for MS AND CD4 yields twice the results as corresponding searches for CD8
or B cell and four times that for NK cells While CD4 T cells may represent the minimum requirement to mediate CNS
autoimmunity it is clear that the immune response underlying human MS is far more complex and involves numerous other
immune cells and subsets This is well illustrated by the observation that MS patients treated with an anti CD4 depleting
antibody did not gain any clinical benefits whereas removal of several lymphocyte subsets using an anti CD52 depleting
antibody has been shown to impede disease progression In particular the pathogenic role s of non CD4 T cell lymphocytes is
relatively poorly understood and under researched despite evidence that these subsets contribute to disease pathology or
regulation For example the observed oligoclonal expansion of CD8 T cells within the CNS compartment supports a local
activation CD8 T cells with polarized cytolytic granules are seen in close proximity to oligodendrocytes and demyelinated
axons in MS tissues The presence of B cells in inflammatory lesions and antibodies in the CSF have long been recognized as
features of MS and Rituximab a B cell depleting therapy has been shown to be highly effective to treat MS Intriguingly the
putative MS therapeutic reagent Daclizumab may function in part through the expansion of a subset of immunoregulatory NK
cells NKT and T cells may also play a role in CNS autoimmunity given that they respond to lipid antigens and that myelin is

lipid rich While different animal models recapitulate some of these aspects of human disease identifying appropriate models and measures to investigate the role of these less well understood lymphocytes in MS remains a challenge for the field This Frontiers research topic aims to create a platform for both animal and human focused researchers to share their original data hypotheses future perspectives and commentaries regarding the role of these less well understood lymphocyte subsets CD8 T cells B cells NK cells NK T cells T cells in the pathogenesis of CNS autoimmunity **T Cell Subsets in Infectious and Autoimmune Diseases** Derek J. Chadwick,Gail Cardew,2008-04-30 T cells are a specialized population of immune cells that aid the immune system in combating various types of invading pathogens This book presents up to the minute data on the role of T cells in autoimmune diseases **Biomedical Index to PHS-supported Research: pt. A. Subject access A-H**,1992 *T Cell Regulation by the Environment* Anne L. Astier,David A. Hafler,2015 Na ve T cells get activated upon encounter with their cognate antigen and differentiate into a specific subset of effector cells These T cells are themselves plastic and are able to re differentiate into another subset changing both phenotype and function Differentiation into a specific subset depends on the nature of the antigen and of the environmental milieu Notably certain nutrients such as vitamins A and D sodium chloride have been shown to modulate T cell responses and influence T cell differentiation Parasite infection can also skew Th differentiation Similarly the gut microbiota regulates the development of immune responses Lastly the key role of metabolism on T cells has also been demonstrated This series of articles highlights some of the multiple links existing between environmental factors and T cell responses Recent Advances in $\gamma\delta$ T Cell Biology: New Ligands, New Functions, and New Translational Perspectives Dieter Kabelitz,Julie Dechanet-Merville,2016-02-16 Gamma delta T cells are a small subset of T lymphocytes in the peripheral circulation but constitute a major T cell population at other anatomical localizations such as the epithelial tissues In contrast to conventional T cells the available number of germline genes coding for T cell receptor TCR variable elements of T cells is very small Moreover there is a preferential localization of T cells expressing given Vgamma and Vdelta genes in certain tissues In humans T cells expressing the Vg9Vd2 encoded TCR account for anywhere between 50 and 95% of peripheral blood T cells whereas cells expressing non Vd2 genes dominate in mucosal tissues In mice there is an ordered appearance of T cell waves during embryonic development resulting in preferential localization of T cells expressing distinct VgammaVdelta genes in the skin the reproductive organs or gut epithelia The major function of T cells resides in local immunosurveillance and immune defense against infection and malignancy This is supported by the identification of ligands that are selectively recognized by the TCR As an example human Vgamma9Vdelta2 T cells recognize phosphorylated metabolites phosphoantigens that are secreted by many pathogens but can also be overproduced by tumor cells providing a basis for a role of these T cells in both anti infective and anti tumor immunity Similarly the recognition of endothelial protein C receptor by human non Vdelta2 T cells has recently been identified to provide a link for the role for such T cells in immunity against epithelial tumor cells and cytomegalovirus

infected endothelial cells In addition to classical functions such as cytokine production and cytotoxicity recent studies suggest that subsets of T cells can exert additional functions such as regulatory activity and quite surprisingly professional antigen presenting capacity It is currently not well known how this tremendous extent of functional plasticity is regulated and what is the extent of TCR ligand diversity Due to their non MHC restricted recognition of unusual stress associated ligands T cells have raised great interest as to their potential translational application in cell based immunotherapy Topics of this Research Focus include Molecular insights into the activation and differentiation requirements of T cells role of pyrophosphates and butyrophilin molecules for the activation of human T cells role of T cells in tumor immunity and in other infectious and non infectious diseases and many others We are most grateful to all colleagues who agreed to write a manuscript Thanks to their contributions this E book presents an up to date overview on many facets of the still exciting T cells Dieter Kabelitz Julie D chanet Merville Bacterial Virulence Philippe Sansonetti,2010-04-05 Starting with basic principles this reference and handbook discusses examples of the most advanced models of bacterial infection with regard to their value as paradigms to understand the molecular cross talks between microbes and their host and tissue targets It adopts a very forward looking advanced approach placing special emphasis on the main global challenges facing scientists today such as pathogenicity vs commensalisms infections in immunocompromised hosts and species specificity issues
