Regulatory T Cells in Inflammation Leonie S. Taams, Arne N. Akbar, Marca H.M. Wauben, 2006-03-30 Regulatory T cells are essential components of the immune system and several different subsets of regulatory T cells have been described Considerable regulatory function has been attributed to the CD4 CD25 T cell subset These cells act by suppressing adaptive and possibly innate immune responses thereby maintaining or restoring the balance between immunity and tolerance The suppressive effects of CD4 CD25 regulatory T cells are cell contact dependent Recent developments and viewpoints in the field of CD4 CD25 regulatory T cells as well as the potential use of regulatory T cells in immunotherapy of inflammatory diseases are discussed in this volume By linking data from experimental models with recent findings from the clinic this book will be of interest to immunologists and other biomedical researchers as well as clinicians interested in the regulation and manipulation of the immune response during inflammatory disease Regulatory T Cells in Inflammation Leonie S.

Chronic Inflammation Masayuki Miyasaka, Kiyoshi Takatsu, 2016-11-01 This book provides readers with the most up to date information on cutting edge research concerning chronic inflammation We now know that when inflammation becomes chronic it acts as a strong disease promoting factor in a variety of disorders including arteriosclerosis obesity cancer and Alzheimer disease Chronic inflammation is hence called as

the silent killer it upsets the body's homeostatic mechanism insidiously In spite of these developments we know very little about the mechanism underlying chronic inflammation Particularly we do not know precisely what induces chronic inflammation or what promotes its prolongation in a spatiotemporal framework Neither do we have clear knowledge about how chronic inflammation destroys various tissues or how it predisposes individuals to many different diseases To make the situation worse we have no effective treatment against chronic inflammation Since 2010 two major research programs CREST and PRESTO aimed at clarifying the mechanisms underlying chronic inflammation were launched in Japan and investigators of different research areas with a brilliant track record were selected by their research proposals Subsequently they have made their best efforts to answer the conundrum concerning chronic inflammation This book is a compendium of such research efforts In each chapter the CREST or PRESTO funded researchers summarize their original work concerning mechanisms of induction progression or resolution underlying chronic inflammation The most emphasized characteristic is the molecular aspect of chronic inflammation The book thus presents the most recent progress made in the molecular understanding of chronic inflammation

The Molecular Mechanisms of Chronic Inflammation Development Masaaki Murakami,Toshio Hirano,

Inflammation is critical for the development of many complex diseases and disorders including autoimmune diseases metabolic syndrome neurodegenerative diseases cancers and cardiovascular diseases Inflammation comes as two types

chronic inflammation which can be defined as a dysregulated form of inflammation and acute inflammation which can be defined as a regulated form. Because of its special role in the aforementioned diseases establishing methods to control chronic inflammation is important for developing cures and treatments. One challenge for this purpose has been the ability to distinguish chronic and acute inflammation based on molecular biology diagnostics. Thus this Research Topic is focused on articles that can shed some new light on the molecular mechanisms responsible for the development of chronic inflammation and its related conditions.

From Molecules to Mothers Robert M. Samstein, Cornell University, Weill Cornell Graduate School of Medical Sciences, 2013. Regulatory T cells are critical for control of immune responses and thus maintenance of immune homeostasis in a variety of inflammatory conditions. The transcription factor Foxp3 is necessary and sufficient for Treg cell lineage development both in the thymus and the periphery and their ability to suppress immune responses.

Deficiency of Foxp3 or Treg regulation results in widespread inflammation in mice and humans highlighting its essential role. However how Treg cells function to limit inflammation in a variety of settings is poorly understood. The work described herein attempts in three studies to elucidate some of the details of how and where regulatory T cells function. In the gut IL 10 activation of STAT3 signalling is shown to be essential for Treg cell control of Th17 inflammation and a resulting colitis suggesting that Tregs respond to and amplify existing negative regulatory circuits. Using DNase seq and ChIP seq Foxp3 is shown to predominantly utilize preexisting or TCR signalling driven enhancers supporting a model of Foxp3 exploitation of a preformed enhancer landscape in order to direct Treg cell differentiation and function. Lastly extra thymically generated Treg cells are shown to be important for maternal fetal tolerance and the mechanisms necessary for their differentiation appear to have evolved in placental mammals. Taken together these studies provide further insight into regulatory T cell function and offer the potential for therapeutic development in a variety of disease settings.

T Cell Regulation in Allergy, Asthma and Atopic Skin Diseases Kurt Blaser, 2008-01-01. This book presents the state of the art in cellular and molecular mechanisms regulating the immune response in allergic inflammation. Special attention is given to the central role of regulatory T cells Treg in immune regulation and induction of peripheral tolerance as well as to the relevance of Th17 cells in chronic inflammation. The importance of Treg and Th17 cells is demonstrated in bronchial asthma, atopic eczema, contact dermatitis and delayed type hypersensitivity. Furthermore T cell mediated regulatory mechanisms in helminthic infections and fungal allergy are discussed. Several chapters are devoted to the therapeutic consequences that these recently discovered T cell functions may have. Their role as a potential target for specific immunotherapy is evaluated and novel approaches for peripheral tolerance induction and treatment of allergic and asthmatic diseases and inflammation are suggested. Stem cell transplantation as a future therapeutic intervention in regulatory T cell disorders is also considered. Well edited and up to date this volume is recommended reading for allergologists, immunologists, dermatologists and any scientist interested in the immunological events regulating allergic inflammation in general and allergic manifestations in different
