Over a quarter century ago Flanders Dunbar in her 1954 compendium on Emotion and Bodily Changes surveyed over 5 000 references on psychosomatic interrelationships including a literature on psychic factors in gastrointestinal disorders dating back to 1845 The title of the present volume suggests a line of descent from these early initiatives but important changes are in the making Indeed the form and substance of long overdue reformulations are clearly reflected in the scholarly contributions which enhance this report of the 1980 Munich symposium proceedings Traditional psychosomatic approaches to understanding the gastrointestinal system and its functional disorders have been based in large part on two virtually unchallenged assumptions In the first instance unobserved indeed unobservable psychological processes have been

considered causally related to disease onset and or to fluctuations in the course of the disease And secondly it has been assumed that psychotherapeutic interventions for disease management should be designed to alter these hypothesized psychic antecedents More recently however a new paradigm for analyzing the relationships involving disordered physiological functions and behavioral interactions has been developed within the framework of what has been termed behavioral medicine The conceptual boundaries of this relatively new approach to behavioral physiology have not yet been firmly established but the major differences between the new behavioral model and the traditional psychosomatic model are brought into sharp relief by the experimental and clinical contributions to the present volume
