## **Regulatory Proteolytic Enzymes And Their Inhibitors:**

**Regulatory Proteolytic Enzymes and Their Inhibitors** Staffan Magnusson, Martin Ottesen, Bent Foltmann, 2014-05-18  
Regulatory Proteolytic Enzymes and Their Inhibitors consists of contributed papers from the 11th Meeting of the Federation of European Biochemical Societies in Copenhagen in 1977. This collection describes the role of proteases in the physiological regulation, a matter of the activation and deactivation of enzymes. The text also discusses the activation mechanism of pepsinogen and other acid protease zymogens. One paper reviews a discovery that of a separate and distinct class of precursors, the pre-secretory proteins, and then discusses other studies on preproinsulin. The text then discusses the primary structures and presumed functions of immunoglobulin precursors. Another paper continues with the work of Reich and co-workers who found that transformation of cultured fibroblasts from different species by oncogenic viruses is related to the production and release of proteases that are responsible in activating the proenzyme plasminogen into plasmin. Another paper discusses plasminogen activation as having some relationship with pathological processes. The book also reviews the plasminogen activator secretion by normal and neoplastic human tissues. The text discusses the results when primary cultures established from biopsies of normal kidneys secreted plasminogen activators in amounts over those secreted by actual malignant tissues. The book then notes the role of neutral and acid proteinases in male reproduction and the role of plasminogen activators in female ovulation. This collection can be useful for microbiologists, research biologists, molecular scientists, and students of molecular biology.

**Temporal and Spatial Regulation of Plant Genes** Desh Pal S Verma, Robert B. Goldberg, 2012-12-06 First attempts to isolate plant genes were for those genes that are abundantly expressed in a particular plant organ at a specific stage of development However many important gene products are produced in a very minute quantity and in specialized cell types Such genes can now be isolated using a variety of approaches some of which are described in this volume The rapid progress during the last decade in regeneration of a number of crop plants and the availability of molecular tools to introduce foreign genes in plants is allowing the engineering of specific traits of agricultural importance These genes must however be regulated in a spatial and temporal manner in order to have desired effects on plant development and productivity The habitat of plants necessitate adaptive responses with respect to the environmental changes Starting from germination of the seed the plant begins to sense environmental cues such as moisture light temperature and the presence of pathogens and begins to respond to them Little is known about various signal transduction pathways that lead to biochemical and morphogenetic responses in particular transition from vegetative to reproductive phase With the availability of tools to generate specific mutations via transposon tagging identification and isolation of genes affecting these processes may be facilitated Transfer of these genes into heterologous environments will allow understanding of the complex processes that control plant development **Regulatory Proteolytic Enzymes and Their Inhibitors** Staffan Magnusson, 1978
